All of this was done, of course, after I had already called three times and spoke to three different officials (within 6 weeks of this) and had been told that my plate was being issued and was on it's way... I was checking because I had upgraded and wanted to be sure that my new call was going to appear on the plate.

Not having the call on the plate hurts, because I am active in RACES and AREA and the local peace officers recognize those plates and allow those with proper RACES or Emergency Preparedness identification onto sites where we are needed... without this plate, I have had to secure ADDITIONAL identification which has to be specially verified (in other words, it's a large pain in the butt).

Anyone else with similiar horror stories?

|To modify the 200XLT for recieve of cellular service:
[hardware modification omitted]

Ummm.... You might find it much (MUCH) easier to simply add 27.1 MHz to the cellular frequency that you want to receive. I can search through the 894.0125 to 915 MHz area and find ALL sorts of cellular traffic on my Bearcat 200XLT.... Though I never listen to it :-)...

Also... This doesn't void your warranty like the modifcation will.

BTW: I thought the mod was to *add* a resister, not cut one out....

Somehow I get the impression you don't want him to be a ham. Why?
Can you explain just what the character of personality is that is not
good for ham radio? Can you prove it? If you can, I will gladly
petition the FCC to add a personality profile exam to the other
stupid test we now give to try and filter the good from the bad.

Hi there!

I'll appreciate any help on how to get a copy of the
Operator's Manual of the AZDEN PCS-5000.
I tried to get one from the distributor in the US, but
was told that this model is obsolete, and they don't have
any manuals (they sent me the Service Manual, but it has
no operations information).

I didn't succeed to use the PL and the touch tones (I checked
and I have the IC's for these two functions). I also didn't
find out how to change the split freq's for repeater use
(I can do that using the A and B VFO's).

(My BITNET account number is DFAH100@BGUNOS)

There is a really useful TVI troubleshooting flowchart in the ARRL Amateur Handbook. Maybe the noisy neighbor can find one, and walk through it with you.

I recently found the cause of my TVI problem - it was a corroded connection on the TV antenna. When I hit it with 500 watts from any amateur band, the corrosion acted as a diode, and then retransmitted harmonics (diodes produce harmonics all by themselves, because they have a nonlinear voltage/current characteristic). Since a TV antenna is a tuned circuit, it selected FOR the harmonics within the TV bands and re-radiated them.

RE: Dashless Morse.

The code in use on the air today is properly called "International" code or something like that. "Morse" refers to the old land-line telegraph code.

Morse was never originally intended to be received by ear. They used a paper tape travelling under a pen. When the key was pressed, the pen lowered and made a mark on the tape. The term "mark" is still used to refer to the "key down" state in RTTY transmissions.

The tapes were then read visually by operators trained for the purpose. Some of them soon found, however, that they could copy the code aurally by listening to the clicks of the receiving machine. Edison, for example, was one of the young "hot shots" who learned to do this.

Later, the pen-and-ink machines were replaced by "sounders" and all reception was done by ear. When radio came along, with it's continuous tone (or buzz, in the case of spark), the International code was invented.

>to form the dashes. He said that this was his only contact while a
>POW and it kept him from going crazy.

A recent article in (I think) a Sunday newspaper magazine described
the tap-code used in the Hanoi Hilton. The alphabet was divided into
a 5x5 grid; the X and Y coordinates were tapped out.

It wasn't morse. (Incidentally, a number of published works on codes
have described "prison codes" like this.)

Of course, even if the original posting were true, it wouldn't be an
argument for requiring ham radio operators to learn morse. It would be
an argument for requiring soldiers to learn morse. Yours for the

On College-based ham radio:
The situation here at IUPUI is: They call this place "Degrees 'r' Us"
because it is so dead. There is no interest in anything here. A frat
can't even start here due to lack of interest. We have a station (W9PU)
that consists of a Collins KWM-2 and a Drake TR4C and a Yaesu Memorizer.
The antennas are falling down (A tri bander beam and a 6-2 meter beam)
and the old rotors are froze up. There are new Channel Masters that the
school bought but now won't let us up on the roof to fix them.
"Liability and State Law" they claim. Oh well...so much for college radio.
I'm not too keen on the "Keg and Key" idea...too much of that down on
3913.
On no-code:
I've tried recruiting people into ham radio. I learned the code at age
12. Got my novice at 13. (I'm 20 now) SO why does it seem that we must drop
code to justify our ranks? I'm in favor of the proposal but it just
doesn't seem right that we do that. All code and theory takes is determination
and a little effort.
Back to recruiting, I used to wear my HT on me and when someone asks, I give
a small recruitment speech on Ham radio. They seem to think that it's nothing
more than some sort of noisemaker, and it does wonders to Walkmans (them
cheap junks), so nobody seems to like it after that.

Kok Chen suggests that the "communicator class" licensee be given what is currently the CW bandspace. He also incicated that he has a newly-acquired Extra Class authorization. So let me make a proposition: Lets let the Communicator Class have the bandspace now set aside for the Extras (Most of it in the HF bands is on the CW end anyway).

I post this as tongue-in-cheek commentary on arguments involving what bandspace to make available to the new license class. Most of them sound like politicians who demand spending cuts, but "cut somewhere else, not in my area". It makes more sense IMHO to carve into the commonly-used voice space, since there is much more of it. My guess is that Kok Chen does little CW work, whether or not he can copy 20WPM. Otherwise, I don't think he would have made a suggestion that would, in effect, take away all the bandspace he has to operate in. Now the question arises: "Why did he expend the trouble and effort to obtain the Extra?" The challenge? so he can be a VEC? a sort of status symbol? to have access to more bandspace? The answers to these questions might as easily apply to those who take the time to learn CW in order to get on the air in the Ham bands (as opposed to, say, the CB band)

>
> Use a 120V cap...ring voltage is around 100VAC...
>

Better use much more than that. Ringing voltage is anywhere from
86 to 100 volts rms at 20 Hz superimposed on a dc voltage that can
be anywhere from about -42 to -56 volts (at least in what used to
be the Bell System). Given that peaks on the 20 Hz sine wave can
run up to about 140 volts, you get voltage swings of at least 200
volts in one direction, and you should be allowing some safety factor.

The FCC has opened Pandora's box by proposing license-class restructuring, not just a no-code license. I fear that they have not fully thought out the effects of their proposal to cease issuing Novice and Technician licenses. Whether or not the FCC issues NEW Novice and Tech tickets, the present holders will be around for many decades. The Commission is proposing a new Communicator class of license, so we'll now have SIX classes of licenses..... make that SEVEN, since they also propose both "code" and "no-code" variants of the new class. WOW!!!!!!!!!!!!

I understand that the FCC ham database program was written to allow only six license classes. It would be painful and expensive for them (to contract out) to change this program. I would be surprised if they had any intention of any such change. I suspect the FCC doesn't see the "Communicator w/code" and "Communicator wo/code" to be different classes, but aren't they really?

I am such an O.F. that "I have a dream" that maybe we should try to propose a license structure going part-way back to the good old days of just Class A (now Advanced) and Class B (now General) licenses. Maybe with no-code, etc., it might take three or four classes, BUT CERTAINLY NOT SEVEN.

Even when "incentive" licensing came along in the 50s, all calls came from the same pool. Then the "administrative neatness" folks arrived and the present call zoo started. As soon as they allowed the old call to be kept upon upgrade, the whole special calls for special classes concept fell apart - but has been continued anyway.

How should the FCC reduce the license-class proliferation, accomodate the current licensees with roughly their current priviledges, and (if you believe in it) add a no-code class????????

I'm not happy with the approaches I've thought of; what do you suggest? I look at "endorsements" as really being additional license classes - you'd have to use bits in the data base to keep track of them, and they just ADD to the zoo of too many increments of priviledges (IMHO).

Putting on flame-proof suit, I am

FCC AMENDS PRIVATE OPERATIONAL FIXED MICROWAVE SERVICE RULES
TO FOSTER RADIO LANS
8 February 1990 PR Docket 88-191
The Federal Communications Commission has amended its rules governing the use of the 10.6 and 18 GHz bands by licensees in the Private Operational Fixed Microwave Service (POFMS).
Among the changes intended to promote more use of these channels, the FCC decided to allow 18 GHz licensees to operate multiple low-power transmitters (radio LANs), instead of one high-power transmitter serving a number of remote stations, within their defined coverage areas; removed the "digital only" restriction from the 10.6 and 18 GHz bands (however, "video entertainment" can't be distributed in the 18 GHz channels); changed the application procedure so licenses can be issued on a "first come, first served" basis; set a 35 mile separation standard for co-channel systems (instead of 50 miles as before); and eliminated the need for detailed interference analyses as part of most POFMS applications. Under the new rules, applicants must notify the operators of nearby systems assigned to the adjacent channels and prepare an interference analysis only if one of them objects to the proposed facility.
Under the new rules for radio LANs, a licensee would specify a coordinate as the geographic center of the proposed network, with the right to put multiple low-power devices within a certain radius from that reference point without the need for additional coordination. The 35-mile standard would apply to the central coordinates of radio LANs operating in the same channel. According to an FCC news release, "the 35 miles separation standard would provide an adequate service area of approximately 12 miles and will better accommodate new station entry."
During the question period, FCC Commissioner Marshall asked Ralph Haller, chief of the Private Radio Bureau, if he expected a lot of people to apply for 18 GHz radio LAN licenses. "I certainly do expect that the band may be widely used for that, and there has been some expression of interest already in that kind of operation," he replied.

With all the college club members comming out of the woodwork, I feel compelled to drop my input as well. As former officer and present member of the Southern Illinois Univerisity ARC, I can understand where time for studies, radio, and "extracurricular activies" could be time consuming. The club here is alive and kicking and doing quite well. This past year we have seen a significant increase in involement, especially in new members. We are in the process of installing an NETROM packet node, quite active on the HF bands, and all round doing quite well. Just got a stack of cards back from the BURO and we are only 3 short of DXCC. (Most of those countries have been worked withing the last years or so.) As far as the station facilites go, it is not "top of the line" but I find it quite, if not VERY, competitive. I have only had three instances when I have not been able to break the pileup for that rare DX country. I still find time to work DX between my full time job and grad school. So, there are some of us out there still plucking away on the air. By the way, last year three Universities (U of Illinois, U of Arizona, and SIU were the heads of a college net that met on Saturday afternoon. If anyone is interested in getting this started again, lemme know. Speaking of warm beer, I am on my way to have a cold one. What the heck, work is only 6 hours away.

The sounder created two clicks - one on make and another on break. The length of time betwen them determined whether it was a dash or a dot. The make click and the break click commonly sounded different, depending on sounder design and spring tension adjustment.

An interesting sidenote on the original landline telepgraph: Samuel F. B. Morse's original instruments used pens to make marks on paper tape. Operators were to 'read' the marks and translate them into written text. Ol' Sam was blown completely out of the water later when he noticed his experienced operators were writing down the messages from the sound without looking at the tapes. Apparently, the notion that it was possible to copy telegraph signals by ear had never occurred to him.

Nobody is proposing that. Just that those on VHF who aren't going to use it,
needn't be tested on it.

Great!!! That's a really big boost to 'the cause'. I'm still not certain it
makes sense not to start with full privileges above 30 mHz. For openers, the
FCC among others have been bitching about underuse of 6 meters for a long time.

1059. Grounding(?) Problem

Newsgroup: rec.ham-radio
Date: 1990-02-15 11:31:26 UTC
From: Pete_Simpson@DGC.MCEO.DG.COM
Message-ID: <9002151131.AC00041@adam.DG.COM>
Source record: 13413

CEO summary:
Bruce Sawyer writes that his rig stays in transmit mode when using CW with the beam pointing towards the rig. He seems to have the rig grounded (:-), but to me, it sounds like the RF is going in through the keying circuit...try using coax and bypass caps on the lead going from the key to the rig. If you have an electronic keyer, check that it's not being overloaded by RF as well.
good luck,

>stuff. C'mon. ALL of my stuff is faulty? My question is, what can I do to
>get him to quit this frustrating interference?

Every last thing is getting interfered with? That's actually pretty unusual. Still, it's quite likely that he's radiating a clean signal, and that your electronics - particularly if they're cheap or old - are picking up something they're not supposed to. The FCC has run several studies, and they all come back the same: the majority of consumer electronics are woefully inadequate when it comes to rejecting signals they're not designed to receive, such as your neighbor's transmitter. There's a book they publish on the subject, which you can get free by contacting your nearest FCC office.

One little-known item: the FCC standards for telephone equipment do nothing to protect them from RFI (radio frequency interference/interception), and the phone company is your only hope there. They can provide filters to keep the signal from coming in on the line into your house. You have to press them pretty hard, though.

I know it's frustrating, but he's (probably) right: it IS your stuff. All of it. He's putting out a signal he's licensed to radiate, and if your electronics are receiving it, I suggest you deal with the manufacturers about it. (This assumes he's putting out a clean signal, which is reasonable to assume for modern ham gear.)

Here's another advantage, Scott: it makes it easy to remember your license plate number. Seriously! This is moderately helpful when checking into motels.

But in spite of this and the larger advantages, I discarded my ham plates a couple of years ago. The problem was that (in Idaho where I reside), call letter plates are treated as a "special" and are not automatically renewed by mail. It was necessary to make a trip to the Motor Vehicle Department each and every year during work hours and stand in line to pay my extra $5. It didn't seem worth the effort :-(

Yup -

When I was in high school, my cars were registered under my dad's name because it made a *big* difference to the insurance weenies (they kinda start salivating when they see stuff like "Age: 17 Sex: M Car: 1968 Camaro w/ V8"). Anyway, this made it nice for insurance, but nearly impossible to get a ham plate with *my* call on the car since I wasn't the registered owner. They had no with problem putting Dad's call on, but it's just not the same :).

I just gave up until after I turned 18 and had another car to register. The only snag was when they showed up with one "KA7AYF" plate and one "KA7AFY" plate. Apparently Guido hadn't had his morning coffee yet.

The earlier comment about nobody knowing anything when you apply is certainly true in Washington State, too.

- Glen

You could try a phone call to WES Electronics here in Winnipeg.
The phone number and address are:

WES Electronics
1515 King Edward St.
Winnipeg, Manitoba
R3H 0R7

(204) 632-1260

I just called there and talked to Dennis (ask for him when you call)
and they have stock on the 6l6 and 6CA7. He said they are about the
only two they are going to stock, but they have a good source in
Sylvania Canada. They have dumped a lot of tubes since I worked there
(2 years ago), but still have a bunch they want to get rid of. Give
them a call and you may get results!

Ciao!

1065. Thermal Noise and Random Thoughts

Newsgroup: rec.ham-radio
Date: 1990-02-15 16:59:31 UTC
From: DEFRANCO@TOPS20.RADC.AF.MIL
Message-ID: <12566582524.10.DEFRANCO@TOPS20.RADC.AF.MIL>
Source record: 13416

Just a couple of quick items. First, the code/no-code debate seems to be restarting again. Please let it lie. The sides are already taken and positions established. I was a non-ham supporter of no-code, until I got tired of waiting. I figured I was an intelligent adult who wasn't going to let some silly 5 WPM code test get in my way! I borrowed some practice tapes from some ham friends, and within 10 days passed both code and written tests with very little effort. (PLEASE - this does not imply that everyone can do that) Within the next month or so I intend to have my Tech license. So, to everyone who says they want to be a ham but think code is a stupid requirement, all I can say is that you either wait for the codeless license class, which could take some time, or put the power of positive thinking (where have I heard that phrase?) to work and pass the code test.

Second item: Capacitors for filtering on telephone lines should be rated 200 WVDC. I spent ten years doing phone system work, and almost every circuit that places caps across the two-wire line pair is rated 200 volts. Ringing voltage applied at the central office is normally 105 VAC, but it is superimposed upon the -48VDC central office battery power. If you look at the potssible peak voltage is it 149v (peak ring) plus 48 v (dc battery) for a total of 197 volts. Be safe - use a 200 volt cap.

Third item: (okay, I got carried away) Ground rods and grounding are topics that have been widely discussed, especially how to get good ones. If the ground is for the AC power system, the NEC requires not more than 25 ohms, which in my book is almost useless. Consider a fault that applies 120VAC to the ground wires in a house. At 25 ohms, the ground system will only conduct about 5 amps, not even enough to trip a circuit breaker. Even worse, if your rig dumps RF into the same system, it will probably radiate more energy than it conducts to ground. Here's some suggestions to consider:

1. If the ground conductivity is good in your area (either due to high ground water or constantly moist soil from high rainfall), a good ground system should consist of three 10 foot copper-clad ground rods driven at the vertices of a 10 foot equilateral triangle. The three rods should be wired together with nothing smaller than #2 wire. It can be bare or insulated. Wires should be tied to the rods with clamps AND anti-oxidizing compound, usually available at electrical supply houses. The alternative is to braze, not solder, the wires to the rods. This arrangement will normally produce a ground system with less than 5 ohms earth resistance, often less.

2. In areas where little gournd moisture exists, the bentonite method works well, as it holds moisture and effectively expands the area

over which ground currents are distributed. Note that other methods that rely on ionic salt saturation will only work if you constantly "water" the system. Dry earth conducts poorly regardless of how much salt or copper sulphate you deposit into it.

3. In general, any time you install more than one ground rod, you will have potential differences between them - hence the reason for the large wires tying them into a single unit. This type of multi-rod system is quite common for large towers, large ground mounted power transformers, and electrical switchgear.

4. Finally, the old-time solution of tying to a cold water pipe is becoming very dangerous, as many water systems have moved to plastic piping, which as we should all know, conducts current very reluctantly. Unless you are sure the copper lines in your house also tie into cast iron distribution pipes, put in your own grounding system.

I would personally add a YES!! there is time for
radio in college!!!

In particular, here at WPI, we have the WPI Wireless
Association, W1YK, founded in 1909, the oldest college
wireless club in America. We have about 15 members, most
of whom are licensed. Those who aren't come up to the
'Shack (our shack is on the roof of one of the taller
buildings on campus, good coverage everywhere) to either
be social, or to use equipment under supervision. It
works out really well. I personally *got* my tech in
college, in fact, as a graduate student no less.

The best advantage: Lots of friends and fun.

The 2nd best advantage: The club can afford all kinds
of equipment (i.e. a Kenwood TS-940S, tower, antenna
arrays, packet stations, and repeaters) that we can
get access to, that mostly I could only wish to afford
outside of college.

The workload is tough, true, but there is *always* time
for radio, even if just one or two times a week. As for
YLs, well, the ratio at WPI is 7:1, so what difference
does it make!?!!? :-) We may soon have our first female
member (she says she has a license, but can't remember
her call), so even that is getting better. She's cute,
too ... (sorry about editorial comments).

1068. BC-WA Alert radio problem

Newsgroup: rec.ham-radio
Date: 1990-02-15 19:31:58 UTC
From: MEHARP01@ULKYVM.BITNET
Message-ID: <9002170631.AA23312@ucbvax.Berkeley.EDU>
Source record: 13418

I have a BC-WA Weather Alert radio from Bearcat. This is one of the desk type black radios with a big black rocker switch on the top front.

The problem I am having is that the local NOAA weather radio service tends to pop off the air occasionally. When this happens, the radio falsely triggers, presumably due to the white noise being fed to the tone decoder when the carrier goes away. Not so bad during the day but at night it's a drag as you can imagine :-).

Has anyone found a way to fix this? I guess one way would be to add a squelch circuit to the radio but that would be a lot of work. Any info would be appreciated.

Thanks very much. I'll post a solution if I find one.

Has anyone tried the modification for the UNIDEN 2510 10 meter radio that was shown in 73 magazine (Spetember 1989, I think). Several freinds of mine had tried it and it doesn't seem to do anything. I think there was also a mod to get the radio to work above (for satellite stuff) and below (don't ask me why) the 10 meter band. That mod doesn't seem to work, either.

Is this just another example of shoddy Wayne Green-sim or does anyone know how to make these modifications work? 73 John WB2EKK @N4QQ

>So step into the 90s, guys! Let people who really *want* to learn code
>do so freely, but leave the rest of us alone.

>_H*

What's the "90's" got to do with anything. The basis for code requirements are not based on the current level of technology or how much of a variety of equipment is available to use the amateur bands.
The "rest of us" include people who want to use the various bands without taking the time to learn the rules, regulations, and proper uses of the amateur airwaves. Learning code simply shows that you are willing to learn certain disciplines to exercise this privilege. If this is too much work for you(and others), go use CB!!
Having to know code simply keeps out those not willing to take the time to learn amateur radio's basic foundations.

Does anyone out there know of any sources for RCA 4065 triodes? Any help
will be appreciated. Please e-mail unless you absolutely can't.

I am looking for an inexpensive way to start using the oscar sats.
I would like to buy an hf rig (used) that is good enough that a converter
can be put on it to work the vhf and uhf frequencies.

Can anyone give me some feed back about this.

1073. Reciprocal permits for Italy and Switzerland

Newsgroup: rec.ham-radio
Date: 1990-02-15 23:44:43 UTC
From: mrapple@quack.UUCP
Message-ID: <5122@quack.UUCP>
Source record: 13425

Could someone please mail me the details on getting
a reciprocal permit for a less-than-one-month stay
in Switzerland and Italy? If at all possible, I
would like to obtain such permits BEFORE leaving,
rather than try to get through customs without
proper documentation (they may think I'm some kind
of spy :-)). The station will be a 5w 2M HT,
and an address in-country is not yet available.
I have an Advanced class license, call is N6QQQ.

Thanks in advance. If there is sufficient "me-too"
mail, I will summarize and post.

>may be illegal, is to chop their coax early in the morning and then listen to
>them when they scream that their radio (or maybe linear) finals blew up in
>a cloud of smoke!

Tactics like these will only work once. They will most likely go out and
get a new and more powerful final. They will also hide the coax and install
a dummy lead that might be connected to 120 VAC. Try putting a pin into that.
I should also mention that people who believe in illegal CBing also like big
dogs and guns. If these people are your neighbors then the best place to call
is Mayflower.

>I need to extract the braid from some RG-8 coax for use as a ground strap.
>Does anyone have any nice methods that are not too skill-intensive? (I can't
>judge the depth on a long cut accurately enough.) Thanks.

There are cutters made that only go to a limited depth, but you
probably will have a hard time finding the "right" one. If you
have the right tools around, you can easily make one, however.
Simplest is just a machinist's clamp holding a razor blade so that
about 1/32" of it sticks out (that is a corner of the blade, not the
whole length). However, I usually just use a sharp knife across the
coax, essentially flat against it. It seems pretty easy to hold the
cut so it exposes but doesn't go thru the braid.

Good luck ...

Or how about just leaving the braid on the coax and using the whole
thing as the ground strap??

BULLETIN

015UTC Monday, 01-21-90. "Foghorn" observed on the air-to-ground frequency of 6577 kHz. As if AERINC didn't already have enough trouble, what with Numbers transmissions and other types of jammers.

0200 UTC Monday, 01-21-90. The electronic war (?) continues at a highly elevated level as 6577 kHz is bombarded - not only by the "Foghorn", but by a "Buzz Saw Jammer", and the usual 5-D Spanish transmission. Said frequency being rendered totally useless for numerous aircraft in flight.

WAKE UP, State Department!

Exclusive to A*C*E - At some few times during the month of June, 1989, the 5-D Spanish transmission on 6577 kHz was determined to be originating from within a 25-mile radius of Managua, Nicaragua. This information, as usual, from those sources that decline to be identified.
* * * * * * * * * *

* Numbers 101, Part 3 *

Type 3 Transmission Formats

"Atencion 133 00 30" (repeated for several minutes)
"30" (repeated for less than one minute)
xxxxx xxxxx . . . (ciphertext or crypt)
"Final" (repeated twice)

The first three digits are the identifier, with the following two digits an unknown. The last two digits before the crypt are the "group count" digits.

To the best of my knowledge, this transmission format is seldom heard - I would be very interested in reception reports from any of you who might encounter it.

And speaking of reception reports, the *IDEAL* report would consist of the Identifier, Group Count and the first three and last 5-digit groups of the crypt. This in conjunction with the usual details regarding frequency, time in UTC, etc. Now, while I realize that this is time consuming and out of the question for most - any of you who would be willing to spend the time would be contributing greatly to Numbers research efforts.

If you listen very carefully to 5-digit and CW transmissions, you'll find that the pause after every tenth group is slightly longer than that between the other groups of the crypt. If you were to record the transmission at 2.4 cm and then play it back at 1.2 cm, you would notice the pause following the tenth group to be very prominent.

The number of groups is twelve per minute in 5-digit Spanish. The very same for 4-digit English and Spanish. The only exception I've noted in this cadence is in the live, or non-computer generated 5-digit Spanish transmissions.

LADIES DAY AT THE A*C*E

Traditionally, our hobby has been dominated by the male of the species. Look what we've been missing! Well it's time to put those days behind us, guys - because the female of the species has much to offer this hobby and profession.

First - They look a hell of a lot better than we do.
Second - Their skill at ferreting out numbers transmissions is unparalleled.
Third - They just don't get involved in the stupid in-fighting that so many of us 'self-proclaimed experts' so often find ourselves mixed up in. More on in-fighting in a later edition of The A*C*E.

Now I am fully aware that my stance on this issue will result in a hasty - and as usual, ill-prepared - meeting of NOG (National Organization of Guys) to immediately nish HM from saiorganization for ever and ever, amen.

B that's okay, guys. I'm sure that NOW (Nation Organization of Women), while perhaps skeptical at first, will eventually welcome me with open arms.

And just fortarters, here are just a few of the things YLs have contributed to the hobby -

. Potato-Chip, a DC-basedemme, who joins us every Saturday night on-line, is well versed in the ins and ts of the ECPA.

. Ira's Mom - w has her own shortwave radio (which she does NOT share with Ira) - indicates that she s discovered a relationship between Radio Havana Cuba and some few Numbers transmissions. How about sharing the info, Mom?!

. Thyss - a California-based YL who also joins us on Saturday nights. Though only a beginner, she soaks up knowledge aster than one of Rosie's paper towels!

. And lest we forget - there's the highly esteemed Lani Petit, whose shoes I am now attempting to fill. Where are you Lani? The high heels are bothering my feet - and the guys at NOG are giving me a rough time.

. There are Pop'Comm's maven of Radio Nostalgia, Alice Brannigan, Monitoring Times' Gayle Van Horn and Jean Baker and Sharon Churcher and Trudy Miller of Penthouse.

. There's Linda Reneau (KA1UKM) and Joyce Sawtelle of 73 Amateur Radio Magazine and Carol Johnson of Portal Communi-cations.

. And then there's the indefatigable Kristin Kaye - of "Bits, Bytes & BBSs - who has lots and lots of the shadowy types who lurk about the Virginia countryside in a tizzy!

Let's welcome them with open arms, guys - no pun intended, of course!

AND NOW . . . Since this is Ladies Day At The A*C*E, reception reports, for the most part, will be those of Kristin Kaye, of UeL fame (UeL - no relationship to PTL) - with an emphasis on Slavic (?) Numbers transmissions - preceded by musical tones.

4032 kHz 0600 UTC AM 5-D Slavic kk/NY

4881 kHz 0000 UTC AM 5-D Slavic kk/NY
0100
0200
0300
0500

0530
0600 (This parallel to 4032 kHz transmission above)
1900
2100
2200

To my knowledge, no one has ever positively identified this language. Probably not Russian, says kk - no guttural sounds - Czech? Serbo-Croatian? We're just not sure. Give a listen -

this one is there practically every hour on the hour through the day and night. Given propagation issues this one is very curious, indeed.

RACING WITH THE MOON

John Fulford of FL and Zel Eaton of MO report Numbers transmissions in the 32 MHz range. Some years back, Numbers transmissions were reported in the 40 MHz range. I reported this in very small detail in "Uno, Dos, Cuatro."

Strange things happening these evenings on 6840 kHz. Maintain a close watch. 6802 kHz, after a long absence, once again active, and don't forget the mystery of 6835 kHz - shared by Air Force 1, Air Force 2, 5-D Spanish Numbers, and now - by a major electronics manufacturer which has just been granted an experimental license for this frequency. Talk about strange bedfellows . . .

HM's ELECTRONIC RECEPTION REPORT

To: HAVANAMOON
From: John Brewer
Subject: Numbers Intercepts
Date: Sat, 23-Dec-89 08:37:52 PST
Lines: 45

Date Time Freq/Mode Comments
---
15 DEC Z 0145z 6.824.8 AM YL #s, interesting because of the fact that another YL station (#s), was either mixing with, or being transmitted from the background. The station appeared to have a different YL "voice" and different numbers being "read." Both stations disappeared after the "primary" YL station left the air.

Format was "Atencion, Atencion, Atencion" followed by #s groups, repeated, then numbers groups till end of transmission.

CONTRIBUTORS CORNER

John Fulford (WA4VPY), Zel Eaton, Jim Vickonoff, Ira Martin, Ira's Mom, Don Bishop, Mark Pierce, John Brewer and Kristin Kaye.

HAVANA MOON'S COSMIC SPOTLIGHT

This month's Cosmic Spotlight shines on Ira's Mom. Mom will be receiving a one-year subscription to Electronics Handbook, published by C&E Hobby Handbooks, courtesy of Havana Moon and "Los

Numeros."

Next month's winner - to be selected at random, of course - will be the recipient of an original tape recording of one of the most unusual radio intercepts I have ever heard. More about that below! Get those intercepts in!

* * * * * * * * * *

There's been a truly peculiar transmission moving about the spectrum lately, best described as a "Foghorn". Well, could it be that the "Foghorn" is a new and sophisticated jamming device?

One recent Saturday Night while "Numbers Chasing" with the Amigas on "Los Numeros" we came across the "Foghorn" on 7920 kHz at 0500 UTC. Signal strength was very powerful, ranging from well over S9 at my QTH to S7-S8 on the West Coast. And that's not all. Underneath the "Foghorn" was a PAB (phonetic alphabet station) transmitting five character phonetic groups! I noted the signal strength of the Numbers Station to be around S7. Reception was extremely weak in San Diego, and not heard at all in San Jose. This (these) transmissions continued until approximately 0540 UTC. After the phonetic transmission ended, the "Foghorn" continued to transmit.

The phonetic groups were broadcast by a YL using the standard international phonetic alphabet but with decidedly non-standard pronunciation.

Example: LEE-MAH (Lima) NO-VEM-BEER (November)
EEN-DI-YAH (India) U-NEE-FORM (Uniform)

Use of non-standard pronunciation is an indication that the receive-site may use a voice-recognition system.

Back to the "Foghorn" - it was later found jamming 6925.5 kHz, a known KKN50 frequency. It was learned the following day that a complaint was filed by the State Department as a result of this interference.

A new form of jammer? Who? And why? Any thoughts?

An interesting sideline from Harry Helms - Harry says KKN50's marker transmission was greatly enhanced by this mysterious "Foghorn" with nomadic tendencies. Any ideas, folks? It's got the self-appointed experts confused - this, much to their chagrin! And if you think this group is confused, you ought to see the tizzy the professionals are in . . .

HAVANA MOON's PREDICTIONS FOR 1990

Ira Martin will become romantically linked to a world-famous female rock star. This will lead to Mr. Martin's photo being plastered on the front page of many issues of The National

Inquirer.

Harry Helms sightings will become more frequent than Elvis sightings as he is seen scouring McDonald's dumpsters * for Covert Corner material. I beg of you, folks - don't let this happen. YOU're in control. Get Harry some reports before he has to move on to Burger King!

The first Numbers transmission reception report received via a tooth filling will be logged by The A*C*E. The sender of this report will immediately receive a crushed and empty Tecate can. Contents of said can will have been disposed of in HM's own unique style (hic).

John Fulford will get his check or money order off to The A*C*E for a membership - provided he is not molested by any more Mafia Dons.

Ira's Mom will set The A*C*E record for Numbers reception reports while her son frolics on the Riviera with the above mentioned YL.

And last - but certainly not least - Ed Anger, of Weekly World News fame - will be verbally attacked by Andre Provacateur. Look out Ed - Provacateur's World has no room for you! And you're going to be madder than Fred the Fed with no E-Mail system to invade! And if you haven't yet picked up a copy of The Weekly World News - don't start now!

* * * * * * * * * *

Well, folks - the intercept database is ready for distribution. It'll be available in two formats - one print-out by time, and another by frequency. And for you Commodore users out there, a diskette-version will be made available at a later time, if demand warrants.

Here's what you'll need to do: Send a check or money order in the amount of $3.00 made payable to The A*C*E to the Club post office box. Include a stamped, self-addressed #10 envelope with your request. PLEASE - no requests to my Chicago address directly. Distribution methods will be worked out with Kirk.

I'll assume all costs so that the entire $3.00 will go to The A*C*E Treasury.

The first run is now in its final stages, and barring any unforseen computer snafus, will be ready a week to ten days after this issue of The A*C*E reaches you.

* * * * * * * * * *

HAVANA MOON RECOMMENDS

If you haven't done so already - be sure to pick up a copy of the February, 1990 edition of Popular Communications Magazine, and join me and John Fulford, for a "Magical Mystery Tour" of Miami's mysterious KKN39. See it as a "KKN Station" has never before been seen. And I mean that quite literally, folks!

And contact Grove Enterprises for shipping and pricing information about the all new "Shortwave Directory." This 1990 edition contains a new and revised Numbers section, courtesy of Yours Truly.

George Zeller's 1990 edition of "The Pirate Directory" - soon to be available from Tiare Publications.

* * * * * * * * * *

Special thanks to "Fred the Fed", The "Los Numeros" On-Line Amigas, and Olivier Schmidt of The Intelligence Newsletter for a recent profile of HM and Harry Helms. Thanks, also, to Sweden Calling DX'ers, Fred Maia's W5YI Report and Wayne Green of 73 Amateur Radio Magazine for recent mentions of "Los Numeros" and Portal Communications.

Hope to see all of YOU on "Los Numeros" soon. And by the way, you'll find The A*C*E Digest and Veried Response there - courtesy of Kirk Baxter and John Arthur!

And don't forget, guys - introduce a YL to the hobby. You'll be glad you did. And as the legendary Gene Nobles, of WLAC fame used to say - "Titillate your sensibilities."

We miss you - somewhere in time, Gene. And as far as you guys at NOG are concerned, you can . . .

See you at the Denny's on the Beach. Time now for a Tecate and . . .

On second thought, folks, I just might give up Tecate. You see, while on the patio just now, I saw a huge, furry creature with beady eyes running up and down my Cable TV line - I just may switch to Kool-Aid - SharkleBerry Fin . . .

Havana Moon's "Los Numeros" On-Line

** WHAT I"LOS NUMEROS" **

"Los Numeros" is anld Shortwave tradition it's been around
in one form or anothe- since the days when HANA MOON first
hit the Radio scene!

It first appeared as a column in the Newark News Radio Club
Bulletin and later in Monitoring Times. Havana Moon and "Los
Numeros" claim a large and loyal following among hobbyists
and professionals alike.

This nest "Los Numeros" is aull featured magazine-rmat
Shortwave Listening Conference bad on an internationally
accessible comter system operated by the Portal* Communica-
tions Company of Cupertin California.

"Los Numeros" On-Line brgs quality, immediacy d relevant
information to the serious Shortwave Listener - andt does
something no other communicatio or monitoring publication
can do - it provides a unie opportunity for the subscriber
to interact one-on-one with the Expes!

"Los Numeros" On-Line is the perfect blend of two of the
world's most excitingnd fastest growing electronics hobbies -
Shortwave Listening and Personal Comping.

It featus Articles by the Expes in radio and relatedields,
Radio-related Software, Club Inrmation, Special Interest
Groups, Intelligence Updates, a Cryp Corner, On-Line News-
letters and much, much more. The most unusual thing y'll
find here is a weekly *LIVE* DX'g and Numbers Chasing sessi
with Havana Moon y Amigas.

"Los Numeros" On-Line selecd the Portal* System because of
its unique characteristics, including friendly user interface,
on-line documentation, flexibility - d aboe all - its afford- ability.

dditionally, Portal* provides "Los Numeros" Onine subscribers
with access to its E-Mail Gateways to UUCP, ARPA and BITNET.

Portal* is linked to The Usenet, an intnationally distributed
conferencing neork which spans four continents, 30 countries
and tens of thousands of users on over 70 computer systems.

"Los Numeros" On-Line is tomorros technology today - whope
to see you as part of this coinuing tradition!

** WHO IS HAVANA MOON?*

Havana Moon ithe pseudonym of a verwell known figure in
Shortwave Radio, on both the hobby a the professional levels.

As I pointed out earlier, nobody disputes that the "CW Filter" has nice steep
skirts. However, that's only one of two critical criteria. The other one
is insertion loss, and from that aspect, it's a terrible filter.

So, you've never met anyone worth dropping the CW requirement for?

Well, Richard and the folks up at MIT are doing a good job at writing GNU
(GNU's not UNIX). According to their newsletter, they are planning to use the
MACH kernel, and have gcc, gcc++, gdb, and lots of the standard UNIX utilities
already done, so I don't think it's "idealistic" at all.

Seems like the ones not supporting the idea of FSF are the ones that have a
vested interest in maintaining the status quo. By the way, John, do you
send in your money for all those "PD" software packages you use?

It looked like a good idea to me till I got to the call sign part.
I guess these guys won't be allowed to run packet, being as their call sign
won't fit in a TNC. AX.25 only allows 6 characters and the SSID. :-)

But other than that I like it!!

It was noticed by Morse himself long before Edison came along that copying by ear was not only possible but faster.

>Code. Quite whining and just do it!

This is just too much. Mike, how is it that you have come to
believe that you have any more rights than your fellow citizens?
If you think about it, code/no-code is more an issue of the
right of people to access a resource. It is NOT a matter of
laziness or whining.

I for one have come to the opinion that most of our spectrum
should be given over to a public digital radio service, cellular,
and perhaps some space reserved for the people who are really
moving the state of the art forward (eg satellite, digital, networking,
etc). The basic premise here at work is whether Amateur Radio
serves the public good (on the average) more than just reassigning
the spectrum to other services. Some cycles put forth by
a few amateurs involved in Hugo, SF earthquake, etc do not pay the
bills. Sorry. It is my opinion that one useful service to throw
some spectrum at would be something like Usenet, as the knowledge
base created by such networks can only work to our advantage as a
society. We should foster networks such as Usenet by dumping the
Amateur allocations between 50 mHz -> 3 gHz and building the media
required to set up such networking. Licensing would be just a
tech exam. No doctrines on content or use. No grandfathering of
current hams. Amateur Radio used to serve the purpose of creating
various knowledge bases, but lately it seems more a media of endless
contests below 30 mHz, and endless bowling/gall bladder/"I'm driving
to get cigarettes", etc discussion above 30 mHz. What is it that
gives us the right to sit and bullshit on 2 meters for free, when
one car over the guy with the cellular phone has to pay $0.50/minute
to have the same discussion? We need peristroika (sp?) for the ARS
and we need it badly.

Subject: Lid Filters
I doubt that the CW filter has steep skirts. One of my doughters passed the 5 wpm code test knowing about 10 letters of code. She passed because she copied "ood" and they asked the manufacturer of the specified rig. The answer was obviously Kenwood. Likewise she got 7 or 8 others right.

--text follows this line--
Recently I have been thinking of upgrading from an ICF-2010 shortwave receiver to a table top model (NRD-525 or R-5000), but I'm also becoming interested in Ham radio too. My question is whether I should go with one of these receivers plus a separate transmitter, or with a single transceiver. The RDI White Papers for both of these receivers are extremely complimentery. Is the reception on any transciever in a somewhat higher price range (up to $1500) as good as either of these receivers? Are there advantages to having the receiver and transmitter in one package? Any suggestions?

Thanks,
David Kurlander

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

OK, maybe I'm the only one who can read the hand writing on the wall.

!!!NOW HEAR THIS BOYS AND GIRLS!!!

***** 6 meters is going away in the next few years. *****

I can hear all the complaints now. "You're nothing but a doomsayer."

Well, just think back a few years to "Novice Enhancement." Only the
real dummys couldn't figure out that 220-222 MHz was on the way out.

Now the FCC just proposed to restrict any real growth in ham radio
from 6 meters. It seems clear as a bell to me they want to be poised
to take it away just after we lose any court battles over 220-222.

Think about it.

About two months ago in one of the trade broadcast
engineering rags, there was an very good and detailed article
descibing grounding at a new transmitter installaion. I don't
remember if it was an AM or FM. The article went on to describe
the grounding as several rods pounded into the ground then tied
together via copper braid and chemically welded at the
connections.

The concrete was poured one and around the rods. I belived
that they took into account some conductivity that the cement
might have.

As I have thrown the article away, some one may have a copy
out there and perhaps post the Rag and date of the article.

1097. Buying from Japan

Newsgroup: rec.ham-radio
Date: 1990-02-16 21:39:52 UTC
From: pvh@Apple.COM
Message-ID: <38695@apple.Apple.COM>
Source record: 13456
Cross-posted to: rec.ham-radio,rec.radio.shortwave

Just been perusing the February '90 issue of the Japanese CQ. It sure makes ours like wimpy in the ad department. Anyway, I can't believe the price difference between the American & Japanese versions of radios. I've been thinking about getting an ICOM 24-AT, which in this country lists for $629. In Japan (where manufacturers plainly post their retail prices in their ads... what a concept) the price of the AT is 59,800 yen. At current exchange rates (about 144 yen to the $) this works out to about $415. Huh? I always thought HTs were over priced, but this is silly.

Either the Japanese simply want more people to get into ham radio (look at the ratio of the number of Japanese hams to American hams, their no-code license etc.) or American middle men and/or government tariffs are putting the gouge on..

So my question is has anyone here ever purchased a transceiver from Japan and succesfully modified it for American frequencies and been happy with that. Or have you been sorry you didn't have a USA warranty etc. I have contacts in Japan so getting the radio is no problem. I'm just wondering if it's more hassle than the money savings is worth.

Thanks,

Pete

PS - does anyone know about Standard and whether they import all their ham gear? I know that Heath sells some of Standard's HTs under the Heath name (unfortunately not the nice looking dual dand HT), but they have some nice looking base stations that I don't think are brought in to this country. (the tri-band C50 for one)

All this discussion about interference...I've just gotta chime in here:

About 6 months ago, we started hearing all sorts of noise on our baby monitor (the little 49Mhz cheapies). Of couse, since it's a part 15 device, there was little we could do LEGALLY, but I did manage to trace the SOURCE of the interference to the cellular phone tower 150 or so away from our house (our cordless phone also picked up the interference, and by looking at the frequencies, with the help of a ham, we discovered that 49Mhz is a logical place for the local oscillators on a cellphone transmitter). When I called the local cellphone company (the ones who owned the tower) I eventually got a call from some lawyer, who lectured me about ECPA, and ASSURED me that they could NOT be heard on ANYTHING except "authorized equipment" or on "an illegally modified scanner".

Anyway, a week or so ago, my neighbor, who has a cellphone in his car, mentioned that he was having trouble using the cellphone from his driveway (lots of noise, poor signal). He reported the problem, and late last week, the cellphone guys were out climbing around on the tower. Guess what? No more interference on the baby monitor or our cordless phone!

This has the elegance of true genius, IMHO. Although some may object to the amount of theory that would be required to make such an examination meaningful, I have a feeling that most of the arguments against it would be pretty weak simply because technical proficiency is one of the things that is supposed to distinguish hams from the CB crowd... at least it used to.

This is similar to the arrangement that exists (existed?) in the UK. It has worked very well there for many years. Apart from the relative scale of the two nations, ham radio is very similar, and I see no good reason why such an arrangement couldn't work here.

> People who want to prove that they're better than the rest of the rabble
> can take exams for technical proficiency much as current CW whizzers

> is ideal for supplying both.

Absolutely. There is a lot of personal satisfaction to be gained from taking on a challenging task and accomplishing it. Those who want to increase their code proficiency would have some recognized milestones to aim for, and those already proficient could be officially recognized. To some people that's important, to others it's not. The point is that the choice would be available to the individual, and that's a far cry from having an arbitrary code requirement rammed down your throat if you want to operate on the ham bands, regardless of mode.

Does the station still have that 1/3 mile longwire?
I remember seeing it and an Original War of the Worlds Jam All
TVs in the Free World rig (ie a BC-610) about 20 years ago. I always
wonder how they got the 610 up there. Did the entire front line
carry it for the exercise????

1102. Four License Classes are Enough

Newsgroup: rec.ham-radio
Date: 1990-02-17 01:14:17 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9002170114.AA12125@cmr.ncsl.nist.gov>
Source record: 13473

FOUR CLASSES OF LICENSE ARE ENOUGH (For discussion)

Here's a suggested table of license classes and privileges. The
goal is to keep the number of license classes and test elements low.

Present		Proposed	
Class	Code Theory	Class	Code Theory Bands
Extra	20 Extra	Extra	20 Extra Present Extra
Advanced	13 Adv.	Advanced	13 Adv. Present Advanced
General	13 Gen	No longer issued, grandfathered into Advanced	
Tech.	5 Tech	Basic	5 Basic Present Nov/Tech CW plus everything above 28.0 MHz
Novice	5 Novice	No longer issued. Blanket expiration Dec 31, 2000. Code credit given toward Basic requirements.	
----------		Communicator*	0 Basic Everything above 220.0 MHz

This removes the "almost-no-theory" Novice entry route. Is that good?
Many of you disagree with the 220 MHz limit for Communicators, but that is
not a key element of this proposal; the reduced number of classes/tests is.
In about eleven years we would have just four license classes. Remember that
in low-sunspot years 10 meters is a local-contact-only band much of the time.

* I haven't yet been convinced that we need a no-code Communicator class.
If there is no no-code class, then just keep the current structure. We
don't need change for its own sake.

73, Bob W3OTC

My employer does not endorse these views.

Illinois allows at least 7 characters on vanity plates so you should be able to get a vanity-multiple plate for your extra vehicles even with a 2x3 call on it if you are in Illinois. I have also seen a space inserted on one plate WITH 7 letters, so maybe there is room for 8, or you can put a space between the call and a digit.

That's standard procedure in Nova Scotia. The name on the registration
must be that on the amateur radio licence or you can't get your plates.
It was a pain when I was in college as I was a member of EMO(Emergency
Measures Organization) and ARES but the car was registered to my father
to take advantage of lower insurance rates.

Hi Scott,
.
I don't know how many advantages there are to call plates. They are
more a personal thing - I know many hams who don't like them for one
reason or another.
.
On the up side they are distinctive, let officials know who you are in
the event of participation in emergencies, and let other hams identify
each other when traveling.
.
On the down side they mark a vehicle which in all likelihood is carrying
radio equipment increasing likelihood of theft.
.
As to cost it varies considerablly. Here in Nova Scotia they cost an
extra $10 when you first register the plates and about $5 extra
a year unless you need new plates and then it's another $10. The
personalized or "vanity" plates here are by comparison an extra $100 on
initial registration and I beleive an extra $10 a year.
.
Some places don't have them at all.
.

Sounds familiar Dave. A friend and I did about the same thing, stringing
a long wire from a 4th floor dorm window to the roof of a girls dorm
some distance away. It worked great except that it produced the nicest
interference in the adjoining room over stereo speakers and over the
current-carrier radio station on campus. Limited us to operating certain
times but we got on the air with a FT200 and an TenTec Argo.

Cheers!

Two point need echo for emphasis here:
first is that both parties share responsibilities
second is that we shouldn't have to put up with poor design in our consumer grade gear (what the hay, manufacturers are often amazingly sensitive to feedback, and they've probably got great data banks...fire off a letter or two!)
A lot of RFI can be fixed with a couple of capacitors or a choke in the power line (which works more or less like turning the extra length into a very crude coil which "chokes" the high-frequency RF).
There are always a lot of hams around who can come up with a quick fix...sounds like the neighbor is a LID!

From a survivalist point of view CW is what Esperanto was meant to be, a universal language (of sorts).
From a ham point of view, CW is a filter...show me another medium that is so open to abuse and yet so (relatively) well behaved?
There's no reason to bar communications/innovation minded people from the ether, and I don't really think there's that much of a conflict (Marconi wasn't using/could not have dreamed of SSB) so long as there's an understanding of the different need and the different desires. When I had my "best of all possible worlds" filter operating, I had no problem with the 40 metre AM stations...and I've been operating 40 ever since. Does anyone **really** want those freqs for packet?!
How long has Wayne Green been yelling at us to use 220 and up. What better way than a new wave of digi-peaters and birds. So we'd have the "transmit" priviledge (for the appliance operators sorry!), the "voice" priviledge, and for the truelly communicative, the CW.
All we need to do is focus on the common ground, i.e. communications.

Har! Har! You really showed him.

Above is a prime example of a tunnel-visioned ham who has the
conceit to condemn others who, in his lofty opinion, "refused
to use CW (probably because they were incapable)". Well, even
_if_ they were incapable of using CW, what's it to you, pal?
Who gave you the right to decide the admission standards?

This same person then goes on to whine about being frustrated
with "people who do not have CW skills", "and thus refuse to
use it where appropriate". This is brilliant. I suppose his
definition of appropriate here really means "when he wants CW
to be used, to satisfy his selfish wants".

Well, here's a piece of unsolicited advice for you, pal, if you
are really that frustrated with hams who don't/can't use CW at
your convenience. Disconnect your antenna and plug the feed
line into a nice big shielded dummy load, reinsert your head
into your rectum, whine all you want about how you think
you're better than those of us who don't/can't/won't use code

and how you think you are the HamBandModePolice, stamp your
foot, and count the days until we get to play too.

I don't think any purpose is served by arguing among ourselves over whether no-code is good, bad, or indifferent. The real point seems to be that the FCC gives every indication that THEY want it and will wash their hands of us if we fight them on it.

They must think the same of us now as the Army brass did in '39 and '40 of the old duffers who wanted to keep the cavalry on horseback. When you think about it in those terms, the Code Forever troopers look pretty ludicrous.

That's no way to keep our bands.

Dear Friends,
I am new to a Ham radio license (KA3VRV), however, not new to ham, commercial communications, etc.. I'm President of a small high tech computer design and development company involving computer hardware and/or software systems. This includes many specialty areas such as robotics, data communications, CAD/CAM, etc, etc, etc.....far from being a lazy person. Wouldn't you say?

As far as code goes, this has been my inhibitor to getting a license up until now...but I finally got it. I almost had it 20 years ago, but the code didn't interest me then (nor did a code only license back then), and doesn't thrill me now either. I do understand the many good (an well justified) reasons to have the Morse code (minimal radio needed for transceive, gets through were others forms have more difficulty, etc.). I'd like to have a General license now, however, the code's going to hold me for a while.

I think that what ought to be done now is that all ham's be forced to have a minimum code speed of say 5 WPM, a rounded radio theory/history background. Then from there create a list of achievements that have to be met to get to higher license classes. Something like trying to make a balanced meal for a day's eating, or getting a degree from college.

This would allow the new Novice class license to have an overview of ALL forms of communications at a minimal level (code, AM, FM, SSB, pulse, RTTY, packet, etc.). From there the higher class tickets would require a "points" system, 30 points for a tech, 70 General...well you get the idea. The points could be generated by learning and testing for skills in a wide variety of subjects related to amateur radio.

Think of this, this allows every ham to become efficient at what they prefer to do to their best advantage (and the ham communities) AFTER MASTERING THE MINIMUM REQUIREMENTS FOR NOVICE CLASS.

The new novice class would actually require a more rounded general radio background for testing to get to be a ham, from that point on there would be many specialties. This would also keep the "10-4 good buddies" out of ham radio, however, allow more "specialist" to join and enjoy ham radio (as well as benefit the entire ham community).

Think about this for a minute. Wouldn't it be a boring world if all "extra class" careers were just lawyers or doctors? We wouldn't have any chemist, biologist, metallurgist, engineers.....or radio operators!

Why extract it? Use it as is. Trim a little insulation jacket off whereever a connection is required. At each end, connect the center coductor and braid together through a 0.1 mfd capacitor.

From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9002171432.AA12828@cmr.ncsl.nist.gov>
Source record: 13466

Why are there so many US radio amateurs??? The "incidence" of ham radio in the developed countries does not seem to be closely related to any of the factors shown in the table below. I can't find data on the annual fee for license renewal in the various countries. The US free-renewal and ten-year license probably account for our high place in the list. If the US had an annual fee, might we be nearer Canada in the list?
The call book seemed wrong on the number of hams in Japan and some other countries, so they are not listed.

One Ham/ People	Sq mi per Ham	Pop Density /sq mi	Approx No-Code License	Per Cap Income	Country
506	1.6	305	Y	$11 K	Denmark
520	16	32	Y	$ 7 K	New Zealand
539	8	68		$13 K	USA (50 states)
667	14	48	Y	$12 K	Sweden
726	22	33	?	$14 K	Norway
768	154*	5*	Y	$10 K	Australia
826	0.9	931	Y	$13 K	Netherlands
845	1.4	601	Y	$ 8 K	Great Britain
958	1.5	626	Y	$11 K	West Germany
992	165*	6*		$13 K	Canada
1043	35	30	?	$ 2.3K	Argentina
1078	5	204	Y	$ 4.5K	Spain
2039	2.4	840	Y	$10.5K	Belgium
3160	6	493	?	$ 6.5K	Italy

* Much of the territory is unpopulated

Personally, I think some "OF's" have an understandable fear of becoming technologically obsolete. This phenomonon is evidenced in many other areas of human endeavor where technology has made major changes to the way things are done.

I'd be curious to know how many would change their mind about code requirements if they had to be re-examined every 5 years on both code proficiency and current ham radio technology. ;-)

We are also having problems getting new members involved.
Time constraints on current members often preclude activities
necessary to drum up new faces, I'm afraid.

As for the antennae we are using: for 10,15, and 20 meters
we have a 3-element cubical quad at about 135 feet (positioned
atop the southeast belltower of the Ohio Stadium). For 40,
80, and 160 meters, we have a 600 (maybe more?) foot long-wire
suspended from the stadium over to the McCracken Power Plant.
We also put a 40 meter dipole up about 3 weeks ago.

Yeah, there's still lots of beer to drink, and there's still lots of
women to chase. For club members here, though, it's a break from the
parties in which you hear the same music and see the same people and
stand around and do the same _nothing_ -- fun, but only for the first
three weeks of the semester, and then it gets old.

The nice thing about amateur radio is that there's STILL a lot of 'unknown'
out there - i.e. ham radio other than SSB and 2-meters - and places to
experiment. It's VERY hard to find the time to do these things, and I
often feel like I'm in an island of technology which outside hams are
not likely to traverse.

The other problem is that universities don't see a tremendous point in
all of this, and underfund us. Combine that with the fact that almost
every university club I've come in contact with reports the same situation:
dwindling membership, and a few eggheads (like me) keeping the system
going. (Can't tell you how many membership lists I've ... uhh ...
"adjusted" to keep them off my back :-)).

Pete Helme asked about saving money by buying ham gear in Japan.

One thing that has really surprised me is that whenever a Japanese ham comes to visit me, they always want to buy Japanese gear HERE to save money! The last time JH3HBF was here (1988), he said that because the Yen had risen so much against the dollar, the JA ham manufacturers had cut their profits on USA bound gear to the bone, so that US hams could still afford to buy it! He used a VISA card issued by a Japanese bank to buy some VHF gear here by mailorder, had it shipped to the next stop on his trip, and claimed that he saved a bundle.

>Extra Class authorization. So let me make a proposition: Lets let the
>Communicator Class have the bandspace now set aside for the Extras (Most
>of it in the HF bands is on the CW end anyway).

As to the overcrowding of bands, I agree with OM Todd that the way
the bands are segregated according to CW proficiency is not to my liking
either. Countries that have a single class of HF license seem to do
fine. Being able to communicate more rapidly in CW should be reward
enough by itself for bringing one's code speed up. Why do we need to
reserve space for those who do?

Moreover, I sincerely doubt that there will be a sudden horde of
barbaric Communicator class licensees crowding our bands frantically
working CW. Remember, these are the same people we were accusing of
being too lazy to even want to learn morse, much less operate in it :-)

Perhaps Mr. Todd is afraid that by allowing the newcomers in on CW
would mean that the current Novice and Technician folks would have to
compete with more people for spectrum space. Look at it another way -
they will also have more interesting people to talk to, too. We all will.
Isn't this what it is all about? To let more people into the folds?
To enrich Amateur Radio? Remember, these guys and gals would already
have passed the written. And, if they willingly operate CW on HF, they
are *not* the riff-raffs that we are trying to exclude.

> Now
>the question arises: "Why did he expend the trouble and effort to obtain the
>Extra?" The challenge? so he can be a VEC? a sort of status symbol? to
>have access to more bandspace?

Why do people scale mountains? Because it is there! (Actually, Mr.
Todd forgot to list being able to operate space-earth :-) :-).

Originally, when I decided to get a Ham license last June, I had only
intended to get an Advanced. And when I only flunked 1C when I went
to take my tests (hey, since they let you take all the tests in one
sitting for the same $4.95, why not take all 8?), I practiced like crazy
and got the Extra upgrade two weeks later. So, the "extra effort" (pun
intended) that Mr. Todd alludes to is quite minimal.

The only reason it was that easy is that I have been on the periphery
of Amateur Radio for almost 30 years. :-) I finally went for the license
because I wanted to experiment with an antenna form in a way in which

dependence on the Reciprocity Theorem may not be convincing enough.
(Translation: I need to be able to emit RF :-). I assure you it is not
so that I can discuss Geritol on 80. However, it looks like the microSats
are going to get me sidetracked - PSK modems are more fun than cross-field
antennas :-) [Thanks, AMSAT!]

No disagreement at all over not arguing over this, but I do have one
quick question. I have been reading where other people are also making
reference to the FCC "washing their hands" of us if we fail to go along
with them or fight them on this no code issue.

Where is this coming from? Can someone quote a reliable source for this
attitude//statement? In itself it concerns me more than any issue over
"code" or "no-code" and the reasons for that are obvious. But is this
just so much rumor mongering? I would like to know the FACTS behind
this statement. Not hearsay please.

>They must think the same of us now as the Army brass did in '39 and
>'40 of the old duffers who wanted to keep the cavalry on horseback.
>When you think about it in those terms, the Code Forever troopers
>look pretty ludicrous.

I don't think that people that are concerned about the future of ham radio
are "ludicrous" in any way, shape, or form. The people FOR "no-code" in
most cases are just trying to hold on to a requirement that they feel will
have a good chance of instilling some respect for the service among the
people that are taking the test. Maybe they are right, and maybe they are
wrong... but I honestly think that EVERYONE'S heart is in the right place,
both for and against code. There is no need to make innuendo that the
pro-code people are "old duffers" or "Code Forever Troopers".

Be that as it may... isn't your second paragraph in direct contradiction
with your first one? I.E. "I don't think any purpose is served ...."

I haven't seen this thought up, but the no-code license will let
deaf and hearing impaired people become hams much more easily. This
may be an issue here in Rochester, as we have a very large deaf community
and R.I.T. is host to the National Technical Institute for the Deaf.

Just a random thought.

1140. RE: Expanding HF Phone Bands

Newsgroup: rec.ham-radio
Date: 1990-02-18 02:51:24 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9002180251.AA13306@cmr.ncsl.nist.gov>
Source record: 13342

The way I've always heard it, as soon as the US proposes to widen its HF phone bands, the FCC and ARRL mail boxes fill with complaints from HAMS all around the world who don't want THEIR operation (partly phone) to be smothered by the babble of impolite US hams they hear in the US phone bands.

If you lived in a DX country, wouldn't you want some HF frequencies where you could operate phone without every contact being destroyed by US DX hunters?

For example, PJ9EE (who is also a K4) is getting tired of six (where there is little phone operation outside the US phone band) because all his rag-chews are interrupted by the "Break..I need your country" problem. If they only knew that he won't QSL because of this problem.

Maybe rag-chewing isn't very high-tech, but DX hams are people too.

So, Kok Chen, since something like half the HF-band hams in the World are in the US, expanding the US HF phone bands immediately results in "Ugly American" complaints from around the globe. Maybe it's another not-in-my-back-yard situation, but their representatives attend the international allocation meetings just like ours.

This isn't just hear-say, I got complaints directly when I visited the ITU ham station in Geneva years ago.

Message-ID: <4266@helios.TAMU.EDU>
Source record: 13348
Cross-posted to: rec.ham-radio,rec.radio.shortwave

I was looking at the specs of both the Kenwood R-5000 and
ICOM R71A, and it appears that from this the ICOM is superior
both in terms of sensitivity and selectivity (standard available
filters) on all the bands. However, a few reviews I have seen
indicate that the Kenwood is better overall. Based on these specs alone
it would appear that the ICOM is better.

Are there any "hidden" specs or intangibles, so to speak, that I am not
aware of? Reliabilty? Audio quality? Mods and accessories? Inconvenient
operation? Design trade-offs? Noise? etc ...
Both receivers cost the same at EEB.

1146. Apology to K Chen

Newsgroup: rec.ham-radio
Date: 1990-02-18 22:35:40 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9002182235.AA00310@cmr.ncsl.nist.gov>
Source record: 13354

I apparently had my cast of characters wrong in a recent posting where I mentioned K Chen. I hereby apologize to him.
73, Bob W3OTC

1147. Re: Hams per Capita

Newsgroup: rec.ham-radio
Date: 1990-02-18 22:53:26 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9002182253.AA00329@cmr.ncsl.nist.gov>
Source record: 13353

Phil Karn has noted that I listed Canada as NOT having a no-code license, while , in fact, they do have the no-code Digital class. My ommision was intentional. There are SO few Digital tickets that one could say that Canada PRACTICALLY doesn't (yet) have a for-the-masses no-code ticket like the other countries mentioned.
73, Bob W3OTC

1148. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-02-18 23:16:06 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9002190812.AA24908@ucbvax.Berkeley.EDU>
Source record: 13355

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

In response to a posting by Phil, Chris says:

>Above is a prime example of a tunnel-visioned ham who has the
> conceitto condemn others who, in his lofty opinion, "refused
>to use CW (probably because they were incapable)". Well, even
>_if_ they were incapable of using CW, what's itto you,pal?
> Who gave you th right to decide the admission standards?

Chris, Phil didn't set the "admission standards". YOU are the
one who said he would never learn the code. The code requirement
is already on the books. Phil didn't invent it. He took the
trouble to pass the test....and now because you wont, you are
BLAMING Phil!

Chris raves on....

> Well, here's a piece of unsolicited advice for you, pal, if you
> are really thatfrustrated with hams who don't/can't use CW at
>your convenience. Disconnect your antenna and plug thefeed
> line ino a nice big shielded dummy load, reinsert your head
> into your rectum, whineall youwant about how you think
>you're better than those of us who don't/can't/won't use code
>and howyou think you are the HamBandModePolice, stamp your
>foot, and countthe days until we get to play too.

> |__ || | \ | ___| (213) 338-78...!{ucla-se|turnkey}!lcc!chris
> Any opinions or claims above ae mine, unless I stole them from someone
>else.

I am not anti-no-code, but Chris is yelling at US because he wants
us to support him in his quest to get a license without passing part
of the test? WHY?? Does this mean that if I continue to support
no-code, that someday we'll have to put up with this crap from Chris
ON THE AIR?

Source record: 13352
Cross-posted to: rec.radio.shortwave,rec.ham-radio

Ben Krepp (benk@inmet.inmet.com) says:

While doing a casual scan of the low-end of the 60 meter band yesterday (14 February) at about 2220 UTC I noticed that ELWA from Monrovia, Liberia on 4760 kHz was coming in "like gangbusters". A check of the rest of 60 meters revealed that signals from most West and Central African stations were much stronger (and propagation-disturbance free) than I've noticed in quite a while.

With hardly any effort at all I was able to log:

4760 kHz ELWA Liberia
[...other interesting stuff deleted]

It would seem that there was a pretty good DX opening between West and Central Africa and (at least) eastern North America yesterday.

Did other folks experience such a good DX opening to West and Central Africa yesterday, and - perhaps more important - has anyone noticed if this good DX is holding up today?

This weekend there was a major (ARRL) contest, and there were indeed some very good signals from Africa on the 'low' bands. In particular, on 80m (3500 KHz), EL2CX in Liberia was stronger than most European stations, and ZD8Z (Ascension Island, running 100w) was even stronger. There was also a very strong station from Zaire (9Q5BG) - in fact, it seemed suspiciously strong to me, but in view of the above comments perhaps I should be more trusting. The above, and some 'vanilla' S. Africans, were all at their strongest within an hour or so of 0500 UTC in Texas.

There were also some awesome signals from Africa on 10 meters at dawn. Fun!

In article <9002171432.AA12828@cmr.ncsl.nist.gov>,
rc@CMR.NCSL.NIST.GOV (Robert Carpenter) writes:
> Why are there so many US radio amateurs??? The "incidence" of ham radio

I found Bob's table very interesting. My experience with some of
the league leaders may be of interest:

Denmark has the most Hams per capita. It is a country of about
five million - yes less people than Greater Disneyland, yet they
have their own currency and a seat in the UN. The ham licence is
pretty easy. It is a simple bingo test. They have a no-code and a
Novice licence. As I recall, the novice automatically upgrades
in allowable power etc after a year.

The explosion of hams was in my experience an exodus of CB
refugees. But Denmark is a pretty "techie" country with an easy
licence. The regs used to state that you could only talk about
matters that you would not normally talk about on the phone.
There is no "public service" and emergency stuff. Ham radio is
supposed to be for educational and experimental purposes.

Sweden is even more techie than Denmark, this is also reflected
in the ham population who tend to be more builders and
experimenters than the Danes.

Norway, alas I do not have much experience with the Norgies.
Their terrain makes VHF a bit tricky. As I recall, you had to
have an OK from the local fuzz that you were a good boy before
they granted a licence. This requirement may have been dropped. I
know that in the mid 70s they still had a code requirement - one
of the last EU countries that did.

Britain has a pretty tough licence exam. They are pretty
bureaucratic and hard to deal with. But once you get through the
exam, the only difference between HF or VHF/HF access is a 12 WPM
Morse Test. As I recall this test is now administered by the
amateurs themselves.

You may be interested to look at some numbers which is
"Telephones per 100 people" taken from "The World's Telephones"
AT&T Long Lines 1981 (Sorry I don't get sent them anymore, so my
data is a tad old)

Telephones per 100 People: 1981

Denmark 63.7
New Zealand 56.7

U.S.A. 83.7
Sweden 79.5
Norway 45.3
Australia 52.5
Netherlands 50.8
Great Britain 49.6
West Germany 46.4
Canada 67.2
Argentina 10.4
Spain 31.0
Belgium 36.7
Italy 33.7

Note that the above list is in the same order as the previous
posting with the top of the list having the most hams and the
last country having the least.

Interesting that the countries with the most hams per capita
seem to have the most phones per capita.

Hmmm. Well, with the exchange currently around 144 yen per dollar, I think your Japanese ham friends are doing just fine. Another interesting thing is that ICOM HTs, while among the highest priced HTs in this country, are among the lowest priced in Japan! The Yaesu 728 dual band (the 470 over here) currently sells for about 61,800 yen and the ICOM 24-AT, 59,800 yen (that's about a $15 difference). The Kenwood 75-AT is the same price as the 24-AT at 59,800 yen. I think the highest priced HTs in Japan are from Standard listing at over 62,000 or 63,000 yen.

RTTY DX Notes, 1of3, 2/16/90

RTTY DX Notes For Weekending 16th February 1990
Part 1 of 3.
BID: $RTDX1602

From the many reports received during the week, it would seem that the
bands have been fairly active, with some rare DX on air and with more
promised in the near future. We hope that the conditions keep getting
better. Then maybe, some of this good DX will hear some of the poor VK
stations calling out in vain.

Our thanks this week go to I5FLN, JA1BLV, JA5TX, JG1NBD, OD5NG, TG9VT,
VK2EG, W1DA, W2JGR, W6/G0AZT, W0LHS and the Tri-State DX Association VHF
packet cluster. Thanks chaps for all your good information.

QSL Information:

4K2OIL, Franz Joseph Land cards go to Box 341 Omsk 644099 USSR.

HS0E and XW8KPL cards go to Minoru Hisamatsu, Box 59, Kyoto Nishi 616, Japan.

JW7SP cards go to LA3T.

RH0Y/RA4LM collects from Box 88, Dimitrovgrad-12, Ulyanovsk Obl, 433510. USSR.

4K2OT cards go via UB5KM.

EL3MR QSLS via WA8LKS.

HR2JAE is at Box 2020, San Pedro, Sulva, Honduras.

9Q5BG will QSL via F5JT.

HK0/N3JT QSLS via his home call.

Notes of Interest:

XW8KPL has now gone QRT, but he has left the equipment with the natives, and so maybe they will come back on the air soon.

RO4OR is a new call for Moldavia.

D2ALA is now QRV on RTTY.

JH1LBR will sign T32LB from 22nd to 27th March.

A French station is reported to have worked S2AX on 6th February. No further information.

F2CW trip to Sudan has been delayed until September.

JX9CAA will be on Jan Mayen until October.

JA3AUQ will operate 8Q7 from 27 February until 4th March.

Cocos Islands: TI2JJP and TI2CC hope for TI9 either mid February or mid March.

RL8PYL plans for IS0XV (Spratly): 15-30 March, RTTY of course. But they need donations, which may be sent to Joint Venture Kinlong, In Bank Foreign Trading Of Vietnam, Ho Chi Minh City. Phone: 37.0.870.0.579.

OH2BG is going to Avis Island in the 2nd week of March. Plans for Jarvis and Conway later in the year.

USSR prefixes of note. 4K0 floating ice islands, 4K1 Antarctica, 4K2 Franz Joseph Land, 4K3 European arctic islands, excluding Franz Joseph Land. 4K4 Asian arctic islands.

GL DE DX1 (VK2SG) via TG9VT.

1154. Re: FCC release on no-code proposal

Newsgroup: rec.ham-radio
Date: 1990-02-19 12:52:04 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500418@ux1.cso.uiuc.edu>
Source record: 13358

> Actually, there seems to be a pool of evidence that disagrees with this
> claim. Learning the code is often described as a language skill, which
> is quite easy for younger folks.

At the early ages of learning their native language, kids can very easily pick up on other means of communication. Even the kids that end up being the whiz kids and computer nerds in their teens, can learn multiple languages (I mean like Russian, French, Japanses, Esperanto, Morse Code, etc.) very easily IF GIVEN THE CHANCE. Often, and especially at a young enough age, they won't even need to be motivated.

> Some of the 'whiz-kids' may not want to bother with the code, but a much
> larger number of folks their age could do the code more easily than they
> could do the harder theory.

As the ages get later and later, the groups begin to divide up. There is an emphasis now on trying to get more technically inclined people into the hobby because today, very few people are technically inclined in areas of high tech that are a part of our hobby. This is not to say that those who lack technical inclination cannot contribute, because they can, in their own way.

WE HAMS NEED TO BE MORE FLEXIBLE IN ALLOWING PEOPLE TO CONTRIBUTE TO THE HOBBY, THE SERVICE, AND THE PUBLIC, IN EACH THEIR OWN WAY. WE CANNOT MAKE EVERYONE DO AND BE EVERYTHING; THERE IS TOO MUCH IN THIS HOBBY FOR THAT. THERE IS NO REAL REASON FOR LIMITING CHOICES IN ARBITRARY SUBJECTS. LET'S TEST NEW HAMS ON WHAT MATTERS, AND ENCOURAGE THEM TO TEACH THEMSELVES WHAT WE FIND INTERESTING.

> Are we such elitists that we now want only technical wizards, with no
> encouragement for non-technical folks?

Right, we need to make sure the pendulum doesn't end up swing the other way.

I am porting repeater controller code from a R.S. TRS-80 mod 4 (TRSDOS)
to a PC clone. I currently use the mod4's modem control
signals DTR, DSR, etc to control the CW, rsig in and xmit out signals.

I need to know how to toggle the modem control signals or any other form
of input/output signals on a PC from BASIC.

Does anyone have repeater controller code for a PC that can be posted?

Thanks, Pete WW2I

1156. The Perceived Threat to 6 Meters

Before the S/N ratio gets much higher than it already is, I will try and put this one out of its misery. A few years ago a grab was made for a portion of the 6 meter band for use as a Public Data Radio Service. It cited under-use of the band as justification for approval. The FCC agreed with the under-use statement and even agreed with the need for a PDRS, however the proposal was turned down based on the fact that 50-54 is an amateur exclusive allocation in this hemi-sphere. This is by international agreement (IARU). Unless the next WARC changes this, which I think highly unlikely, of all the VHF/UHF/SHF bands, 6 meters is the least likely candidate for a grab by any other service.

I followed this case very closely because at that time both myself and my wife were very active on 6 meter FM and SSB.

^^^^^^^^^^^^^^^^

This isn't a flame. Let's use this as an example. If someone were going to pay me to use code I would probably be up to 35 wpm in a couple of months. NOBODY, I repeat NOBODY, has ever given me a dime to be involved in ham radio.

I can set at a terminal and do all sorts of arcane things on a UNIX system from memory because I am paid to do them. A lot of the things I find very boring, but I know them because it feeds me and my family. (As an example, write a quick and dirty awk filter for the seven dirty words. I don't find awk a FUN language.)

Ham radio is supposed to be a HOBBY. If we are to have any chance of surviving, we have to make the expected benifit worth the trouble of getting a license. The benifit of ham radio is the privilidge of using moderatly new technology (if you stay away from code and 2mFM); the cost is more drugery than most can stand. I don't find awk any more interesting than code but I'm more than willing to learn the syntax. The difference is *I get paid to know awk.*

Either we need to make the benifit of learning code tremendously more attractive, or we need to make the impediment to entering ham radio more realistic. Realistically, we probably can't do anything to push the envelope for ham technology without a large influx of new blood. Some people are doing some wonderful things with technology (the GRAPES 56kb network for instance) but there aren't enough people with enough background to make these things common place for some time to come. The people with the background to make these things happen aren't interested in code.

Just some thoughts. Flame me if you want.
Michael

--
Michael Batchelor / \113\101\067\132\116\132 uunet!wshb!mikebat!michaelb

Back when *I* got *MY* license *WE* had to pass the code test.
And I thought it was a damn stupid idea then too.

Yes, but you can still BUY the radio for $200, right? Let it be installed, then take it out and do whatever you really had in mind with it in the first place, and when you are done, putting it back in is easier because they have already done all the wiring for you, right? Or, maybe I've missed something....

This is true in Malaysia and most of the South East Asian countries. There is
a lot of restrictions on what you can say. Politics is definitely out.

>As I recall, you had to
>have an OK from the local fuzz that you were a good boy before
>they granted a licence. This requirement may have been dropped. I

When I applied for the Malaysian ticket, I had to furnish two reference letters
and take an oath of secrecy. This requirements are due to the communist
insurgencies and the authority feels that ham radio might be used for the
wrong purpose.
> Britain has a pretty tough licence exam. They are pretty
>bureaucratic and hard to deal with.
>
Malaysia followed the footsteps of Britain (being its former colony). So the
exams are twice a year based on the City and Guilds R.A.E. This in itself
slows down the process of recruiting new hams.

Interestingly enough, my first ticket was obtained here and I just applied for
the 9M2 call from here. All the above actually discourages people from taking
up the hobby. There are about 200 hams compared to a population of 15m.
Hams are considered an elite group or "bourgoise" unfortunately.

1162. WEBER picture format

Newsgroup: rec.ham-radio
Date: 1990-02-19 22:41:29 UTC
From: gopstein@soleil.UUCP
Message-ID: <958@soleil.UUCP>
Source record: 13367

After spending the weekend with a pile of hex dumps and Bob McGwier's hints, I think I have the WEBER picture format figured out.

The picture consists of 242 lines of 645 pixels each. Even numbered lines are not sent, so there are only 121 lines in the transmitted data.

Each packet to "PHOTO-x" (where x is the picture number) starts with a three byte header. The first two bytes are taken together as a 16-bit integer which is the x-location of the first pixel transmitted in this packet (0-644). The third byte is the line number (y-location) of the first pixel in this packet (0-241). Note that data in one packet is not necessarily from a single line -- nor does it necessarily start at the beginning of a line. Within a packet, you need to keep track of each pixel's x-ccordinate and wrap to the next line when it exceeds 644. As mentioned below, a pixel's x-coordinate is 3 plus the previous one in the packet.

Within a packet, a zero pixel value marks the start of run-length-encoding. The byte following the zero is the number of pixels in the run. The next byte is the value of the pixels in the run. Real zeros in the data are set to 1.

Now it begins to get strange. A picture is sent in three parts - first pixels 0,3,6,9,...,642 are sent for every odd-numbered line. Then pixels 1,4,7,...,643 are sent for every odd-numbered line. Finally, pixels 2,5,8,...,644 are sent for every odd-numbered line. The data from the even-numbered lines is never sent. Each of these three passes starts at a new packet.

The first pass (starting with line 1, pixel 0) is preceeded by a packet whose second and third bytes are 255. This marks the packet as an informational header. The rest of this special packet contains ascii text describing the picture.

It appears as though the three passes are the Red, Green, and Blue data from the same image. If this is true, the final bitmap (after assembling the three passes) has the following format:

r0,g0,b0,r1,g1,b1,...,r214,g214,b214

for each of the 121 lines.

So far, only PHOTO-9 has anything that resembles a picture. My guess is that the satellite is still tumbling, so they only get reasonable pictures when the lens happens to be pointing at earth when the exposure is made.

My next posting will contain C code to extract the picture data from
stored KISS frames and display it on a VGA display.

1163. WEBER picture C code

Newsgroup: rec.ham-radio
Date: 1990-02-19 22:43:59 UTC
From: gopstein@soleil.UUCP
Message-ID: <959@soleil.UUCP>
Source record: 13366

This is the result of a weekend of studying the hex dumps of
WEBER photo data. It is not intended to replace the full-blown
software that WEBER is working on, but it will help to document
their format in the mean time.

These programs are not robust. They are a hack, but they work.
If anyone has constructive criticism or helpful suggestions, I'd
appreciate hearing them.

This posting consists of three programs to decode and display
WEBER pictures. The first program - photo.c - reads raw KISS
frames, extracts the picture data to a binary file and prints out
interesting information while going through the KISS file.
Some of the AX.25 and KISS code was taken from TLMDC, written
by Bob McGwier. Note that photo.c will only read KISS from
a disk file - not a COM port. I use ZCOMM to capture the KISS
data to a file.

MERGE.C will take two binary picture files, use the second to
fill in missing pixels in the first and write the result to a
third file.

SHOW.C will display one of the three images stored in a picture
file on a VGA display. You can specify which image (1,2, or 3) to
use. The image is shown in monochrome (grayscale).

These were all developed on an IBM-PC clone with MSC 5.1, but they
will probably run on anything.

I can probably provide UUENCODED executables, if someone needs them.

The binary picture file is just the raw picture data assembled
into 121 lines of 645 pixels each (for a total of 78045 bytes).

1164. Re: Removing Braid from Coax

Newsgroup: rec.ham-radio
Date: 1990-02-19 23:40:00 UTC
From: pfluegerm@valley.UUCP
Message-ID: <48bed6b7.15840@valley.UUCP>
Source record: 13368

For reasonably short lengths, I've found it easiest to expose a couple
inches of the center conductor (and insulation), clamp this to a vice,
and pull the outer insulation off.

The braid comes off with the outer insulation, then easily
pulls out of it. For longer lengths it takes more effort
(start from the clamped end, working out to the free end and repeat).

Seems like I've done this with lengths up to about 10 ft.

Message-ID: <267.25E2684E@uscacm.UUCP>
Source record: 13363

Help??? I need the mods for a Kenwood 2550 mobile. I know that it is against the law to transmit on non-amateur freq. with a non-type accepted radio. ...matter of fact, I really only the RX mods.... So no lectures, PLEASE.?.?.?

Also, while I'm asking the Great Network gods for blessings, I could also use help in getting a old Galaxy H.F. rig back on the air. I do not have a book or manual and all it'll do is receive. I blew a capacitor first time it was powered up after buying it. Got that replaced and checked all the tubes(they were okay). No matter what I try, I can't figure where the X'mit is not working. Any ideas, hints, incantations, or worse - a manual???
I'll be glad to arrange payment for a service manual if someone will stand at a copier for the required time......

Thanks,
Wally.......

Well, if they are I should correct some erroneous info I popped into
this thread last week. In Nova Scotia the callplates are available
without fee the first time and without any extra annual fee's either. If
you require replacement plates (ie for damaged ones) then the cost is
$10.The person to whom the vehicle is registered must be the licence
holder to get call plates.

1170. A nice 2M antenna (the stealth antenna)

Newsgroup: rec.ham-radio
Date: 1990-02-20 05:34:08 UTC
From: mrapple@quack.UUCP
Message-ID: <5131@quack.UUCP>
Source record: 13376

I live in a condo, and needed a stealth antenna, so I decided to
try a delta-loop. Trouble is, they have a high impedance, so I
built a 1:9 balun out of a torus and some wire, and the loop.
Here's the details:

Get a torus. I used one from Palomar Engineers' RF Ferrite Toroid
Kit. Included in the kit are the instructions for the transformer.
Take three pieces of wire. Lay the wires side by side. Label one
side with even numbers, and the other with even numbers. Wrap them
around the toroid as a group at least 15 times. Now solder pieces
2 and 3 together, and 4 and 5 together. The 2/3 joint is connected
to the center conductor of a 50 ohm coax. Wire 1 goes to the shield.
Wire 6 and 1 are the output to the loop.

Now cut a wire 79" long. Connect one end to wire 6 of the transformer,
the other end to wire 1. Insulate all connections.

You can arrange the loop in a triangle, a loop, a square or whatever
you like. The wire must reside in a plane, must be stretched out,
and must not cross itself. For vertical polarization, the plane the
wire resides in should be vertical. A circle is the best orientation,
but I've had excelent results with a delta. According to my sources,
this antenna is directional perpendicular to the plane of the wire.

Checks with an el-cheapo 11 meter wattmeter give a 1.5:1 SWR across
the entire 2 meter band. Whether or not that means anything is open
to interpretation :-).

If there are any glaring errors in this post, please e-mail me and
I'll post corrections.

^^^^^^^
>BLAMING Phil!
^^^^^^^^^^^^

NO. DEAD WRONG! YOU HAVE MISUNDERSTOOD. FOOT IN MOUTH.
Tad, you misunderstood my posting completely. 100% wrong.
I was >>>NOT<<< blaming Phil, or even addressing Phil _except_
in the very first line "Har! Har!...." (kind of a mumbled
noise of _approval_/_agreement_ in case you're confused).

Look again, carefully, and you will see that. I just did, and
I noticed that Phil's posting didn't contain a line identifying
the person that _he_ was following up to. And _that_ person is
the person that my posting was addressing, NOT Phil.

BTW, if you look at my previous postings on this thread you will
see that I concur with many of Phil's stated views on this subject.
So Tad, read before you post, eh? I don't think my posting was
misleading regarding who it was addressing, but if it was, then
I apologize to all concerned, especially Phil. 100% unintentional.
>
>Chris raves on....
>I am not anti-no-code, but Chris is yelling at US because he wants

I don't think 'feeling terrible' has ANYTHING to do with knowing or not knowing
Morse Code. I know the code and rarely use it. I haven't been in that
isolated situation of someone being trapped, as I'm sure 90% of us haven't.
>
>Maybe I stated my opinion poorly, but all I am trying to say is: there are

They aren't abolishing it, they are just making an entry license...without
code. From what I read of it, the no-coder can take the 5wpm and get his
tech...which I think is good..give them a LITTLE taste, then they'll want
more. And if they dont want more, then we're no better or worse off than we
were before...

1173. Buying from Japan

Newsgroup: rec.ham-radio
Date: 1990-02-20 06:26:30 UTC
From: dube@cpdvax.csc.ti.com
Message-ID: <9002200630.AA13061@ti.com>
Source record: 13372

The discussion about the difference in prices of radios in Japan and in the US can gain from a study of the difference in price of a Mazda in Japan and the price in the US...or, `for that matter, the difference in the price of a Mercedes-Benz in Germany and in the US. At the root of these differences is Mercedes-Benz in Germany and in the US. At the root of these differences is the "protective" tariffs. Another factor is the age-old "supply/demand" concept.

Agreed, but why is a code test the ONLY way to "work" for a license? In this
day and age a tougher technical exam makes more sense.

I have a no-code Canadian Digital Amateur license. VE6PDQ to you, my
friend ;-). I have no truck or trade with the chicken banders.

My exam covered electronics (at our Advanced Level), modulation
theory, digital theory and packet techniques. It was a "sit down and
write for three hours" type of exam - essay, not multiple-choice. I
did not have access to a question bank. I learned the stuff from
university level textbooks (and lots of hacking on the KA9Q and PE1CHL
code, and our various Vaxen/Suns/what-have-you's).

I also had to do a regs-and-operating-procedures exam. Just like
everybody else. What's this jazz about not taking time to learn the
ropes? CW isn't the ropes, it's a mode. I understand my chosen mode.

>Having to know code simply keeps out those not willing to take the
>time to learn amateur radio's basic foundations.

Rote memorization is the foundation of Amateur Radio? Your problem is
you assume that if a person doesn't want to pound brass, he/she/it
just must absolutely positively have as his/her/its only goal
phone-band ragchewing. As somebody has pointed out, that fact that
all those HF phone op's I hear blathering on about the weather have
passed the code test tends to make your arguement pretty weak :-).

>--Brad Taylor KB6ENW

You're living in the past. A mode is not a weltanschung. It's a mode.
Amateur Radio, on the other hand, is an attitude and an adventure.
I plan to have both :-).

The question was asked about using a TI 99/4A on packet. In addition to the
99/4A you need:
RS232 (either card in PEB or old sidecar version)
Terminal Emulator (TEII will work but is not very useful, TELCO is better)
Disk controller
32K memory
Disk Drive
Editor/Assembler or Extended BASIC cartridge (to run TELCO)
TNC

>bureaucratic and hard to deal with. But once you get through the
>exam, the only difference between HF or VHF/HF access is a 12 WPM
>Morse Test. As I recall this test is now administered by the
>amateurs themselves.

Yes it used to be that you had to go to a British Telecom office to take the
code test. Now, you can take the test (by appointment) with the RSGB at
many radio rallies. 12WPM gets you your HF privileges.
I wouldnt go as far as to call the CEPT license 'bureaucratic' - after all, it
IS valid in most European countries! No hassle about reciprocal licensing
when you go to France for the weekend.

Body handling: 1 inline base64-encoded payload block was not displayed

Here is the postscript for PHOTO-9, the only WEBER photo so far
that has anything resembling anything.

The header to the picture is:

Picture was taken Sun Feb 18 04:53:08 1990
as picture #09 from bank #1 addresses 0095:00FF to 0000:2DF2

I believe that this put satellite somewhere over north east
India. My guess is that the picture is of a land mass, not
the edge of the earth (as it might appear).

I'm also guessing about the aspect ratio -- I've used approximately
645/242 which might be right...

```
%!
/inch {72 mul} def
/picstr 121 string def
/photo
{ 215 121 8 [215 0 0 -121 0 121]
{currentfile picstr readhexstring pop}
image
} def
0 300 translate
8 inch 3 inch scale
photo
```

Source record: 13231

After reading the flamethrowers on here I'll say this:
There are a few here that not only want no-code but also no-test.
Fine. Glorified CB is all that will become of this once great hobby.
I'm reluctantly in favor of no-code but frankly, two things will
happen: 1- Anarchy will be victorious on the bands
2- The idiots that think it's funny to jam and make raunch
noises on thier rigs will ruin the public service end
of ham radio.
Like on the UHF/VHF bands where patches to police are commonly made so
some jackoff decides to fart and do whatever and use obscenities
towards the police officer on the other end...and they certainly
don't like it. When the FCC takes away the ham bands like they
might just do someday, the jammers will still be there...making
havoc and otherwise showing their gleuteus maximiuses.
I'm being grim but hopefully the no-code thing will pass and or die
and whoever the new amateurs may be will be welcomed into the hobby
like others were (like me).

Message-ID: <2613@wyse.wyse.com>
Source record: 13240

Interestingly, when I was getting upgraded from Tech to General I meet a lot of people who had big problems with the Technical side and had no problems with the code at all.

The problem with all of up "TECHO-WEENIES" is that we are spoiled. We work every day on technical problems and do not have to worry about the other areas. Such as writting, art, music, style. When a techincal problem is solved on a computer, Microwave device, Chemical compond or whatever. We do not have to write an Essay on how the problem was solved and its impact on society. The people who do that may not even understand the technical problems or the device.

It took me 4 months to get up to 13 WPM with 30-60 minutes of study +EVERY+ night. I passed the techical tests the first time with 1 week of study (I am up to Advanced now, I was a General for 1 week). But for me to get up to 20 WPM would be another 4 month effort, so right now that is not as important as other things in my life... I also saw people on the other side who were trying very hard to get the technical stuff done, but had the code complete (up to 20 WPM in some cases) but could not get past Tech.

I know this is hard to believe when you had now problem with the technical side. How much trouble do you think morse code is for a farmer (who had no engineering training) vs. the Technical side? I would conclude that the technical side was very tough, while the code came easy...

The point of all of this is the following:

Morse code is not a filter, just like the technical side is not a filter. The two forms help ballance the Ham community. I would sure hate to spend all day working on computers and then come home and talk about that all night...

So all of you who want to get a license do it... If you do not want to spend the effort (on the code or the technical) then be quiet.

You can ofcourse wait for the world to change and then you can try to become a ham...

DE KJ6NN

The TNC-1 has a modem "breakout" connector which allows it to operate with an external modem. You can check out this interface in the manual and schematics. In addition to this, provisions have been made to double the clock frequency of the 6809 to give more processing power, but this requires the "B" version of the MC6809 (MC68B09) processor and peripherals. You may even consider using the Hitachi 63B09 CMOS 6809. Since other timing parameters are settable using commands, the TNC-1 should take you to 9600 baud without too much problem. For a while, the FADCA and K9NG modems were available to experimenters which allowed 9600 baud operation. You may be able to find more info in the ARRL Networking Conference papers from about 5 years ago on all these topics. Sorry I cannot be more specific, but I don't usually have my TNC at work! 73 and CUL.....de WD5IBS (proud owner of 2 original TNC-1s!)

>night...

What people are saying, IMHO, is that ham radio needs technical
people to grow. And that technical training is part of our charter
to start with. Morse is a skill that is arguably less useful than
it was say 40 years ago. Though, metaphorically speaking, most
no-coders I know will not begrudge people who collect antique radios
their rights up until the point they claim all people should use
antique radios :-)

Rich and others:

OUTSTANDING. You've got it almost completely correct. Your one error
is in the red green blue bit. Notice from your photo that the
beginning is the sync. AT the end of the line is the colorburst. This
is a straight NTSC picture that has been digitized by a board that fires
on the vertical sync. The picture you have put up as a postscript file
is WEBER Photo-9 and is picture of the limb of the earth. The satellite
is still spinning down and even though it takes only a 30-th of a
second for a NTSC frame, how many of you have tried hand holding a camera
for a 30-th of a second still shot? As the bird slows down and locks
magnetically (the rest of them have just done this and WEBER has greater
moments of inertia and more mass to despin and lock), the pix should not
smear as this one has. In your Postscript photo, any detail was washed
by this spinning other than the atmosphere along the earth's limb is
clearly visible. You should see it in color ;-). Soon, soon. Rich,
I will post the color decoding formulas so that you can do a little
trigonometry and recover the color information. The lines are NOT
sent alternately RGB, it is NTSC (Bleeccchhhh!).

Great work!!!

>it's more hassle than the money savings is worth.

I purchased my IC-32AT in Hong Kong. The only problem I ran into
was the fact that they use 430-440 for their "450" band (actually
it was rig to be used in Australia, according to labeling on the
box). I think Japan has the same 430-440 band. Upon returning
to the US, I called Icom and learned that it was no problem to
convert it to 440-450. 2 weeks and $50 later, I had my rig back.
I think it was worth it - even with the conversion cost, I was
still $150 ahead of the going price here.

Rich:

One more error you made, ALL lines are sent, you have just been unlucky
and have missed those times when the passes were transmitting the lines.
Once again, ALL lines are transmitted. I wondered why your weber.ps
looked so flat ;-). At any rate, an outstanding job. Amateur inventiveness
never ceases to amaze me. That is what these satellite projects are all
about.

DEVON: Just average four pixels and use four color representation. To bad
there is no good black and white on the commodore but you can always use
a B&w TV. A two level representation is not gonna get it, so give up
the resolution for another two levels.

>
> I know this is hard to believe when you had no problem with the technical
> side.

This is how it was for me when I developed an interest in ham radio. I recall being frustrated that there was a step from Tech to General that only required code proficiency (something I was good at) but no such step up from my Novice license.

I remember asking how I should go about learning "the theory" and I got anwers like "read the ARRL Handbook." Yeah. Go find a 1972 era Handbook and read the first paragraph (I believe it's about electromagnetic waves or something) from the perspective of an eight year old. Right. I didn't even know what a lot of the words meant.

I believe that some of the technocrats occasionally lose sight of the fact that ham radio is a multidisciplinary endeavor. What first sparked my interest is that I could take a box of junk (say, a Viking Navigator) and make "wireless" contacts. It wasn't until after about five years of hamming that I started to develop interest in learning how the junk worked.

End of anecdote. Begin opinion.

And now for my contribution to the rekindled (*sigh*) code/nocode debate. If testing for amateur licenses is to include some variety of lid filter, be it a code test, a rigorous technical exam or whatever it takes to filter out lids/undesirables/criminals/whatever, it should be most rigorously applied to those who are permitted to use the 50 MHz band and down. Why? Because booish behaviour on these bands has the potential to wreck havok worldwide.

Personally, I don't think a rigorous technical exam would be enough to discourage someone talented and motivated enough to build a station capable of upsetting people worldwide on 1296.

Huh? Wouldn't it make more sense to visually or tactily copy Morse code
in this situation? Oh yeah, you must mean packet or RTTY...

1193. The perceived threat to 6 Meters

Newsgroup: rec.ham-radio
Date: 1990-02-21 01:14:51 UTC
From: dube@cpdvax.csc.ti.com
Message-ID: <9002210121.AA01664@ti.com>
Source record: 13247

I sincerely hope Bill Gunshannon is correct in his opinion that there won't be another grab for 6. While past attempts have failed, this is by no means a guarantee that they won't succeed in the (near) future. Radio doesn't change, but the people who use it and the people who make decisions do. We are all witness to the No-Code situation. Things WILL change when enough noise is made by one side, coupled with the slowly-dying noise level from the other side.

I was mildly surprised at the number of responses I received after I suggested that Hams ask for the space between 28 and 50. Apparently there is quite a bit of activity in there. When the available commercial space has dwindled to nil I think we can exect another attempt to get 6 meters. WARC is not a guardian of ham bandspace, and the loudest voice (usually the one with the most money) will prevail as it has in the past.

I still think we Hams could do worse than ask for more of that space; even if it is only a "best defense is a good offense" move.

* SAREX-2 TESTING CONTINUES *
============================

HR AMSAT NEWS SERVICE BULLETIN 049.01 FROM AMSAT HQ
SILVER SPRING, MD FEBUARY 18, 1989
TO ALL RADIO AMATEURS BT

Shuttle Amateur Radio Experiment #2 Undergoes Testing in Huntsville, AL

This week the Shuttle Amateur Radio Experiment #2 (SAREX-2) packet radio
station underwent extensive testing at the Marshall Space Flight Center in
Huntsville, AL according AMSAT Area Coordinator Ed Stluka (W4QAU). This
testing was being perfomed in conjuction with the training of STS-35 Payload
Specialist Ron Parise (WA4SIR) in the use of the ASTRO-1 experiment which will
be primary payload on that shuttle mission. The primary payload, ASTRO-1,
will be used to conduct a number of astronomical experiments. During the
several days of testing this week, radio amateurs in the Huntsville area were
invited to connect to WA4SIR and to receive a QSO number.

This special packet radio station flying on STS-35 on May 9, 1990 will give
each radio amateur who connects to WA4SIR a QSO number confirming their
contact. When the connecting station sends their QSL card in with this
contact number, they will receive back a beautiful QSL card commemorating this
HAM IN SPACE shuttle flight. The SAREX-2 packet radio station consist of a
Motorola 2M FM H/T with 5 watts ouput, a Heathkit HK-21 TNC-2, and a GRiD
laptop computer that has a 40 MB hard disk drive to store the calls of all the
stations connecting to WA4SIR during the nine day mission. The specially
written software which will be running the SAREX-2 packet station is designed
to allow for completely unattended operation and logging of the calls of all
connecting stations. It will also prevent duplicate QSO numbers being sent!
Although no digipeating will be allowed through SAREX-2, connecting to this
packet station will be like any terrestrial packet contact. Just use your
TNC along with your 2m tranceiver, and everything else is the same. After
you have connected and received your QSL number from WA4SIR, on subsequent
orbits you can watch for the SAREX-2 message beacons being sent periodically.
The message beacons will contain information about the flight of STS-35 and
other interesting items.

Look for more information about the SAREX-2 mission in AMSAT News Service
(ANS) bulletins and on AMSAT HF/VHF nets in the next couple of months. For
more specific information about the ASTRO-1 payload, contact the SPACELINK BBS
at (205) 895-0028.

If you try to call Kenwood's service department by phone long distance, be prepared to pay a phone toll just to find out the line is busy.

This is because Kenwood has one of those wonderful systems that prompt you to enter the code number for particular departments. Thr trouble with these things is that you can make a lot of phone calls you have to pay for before you ever get in.

THIS is the reason that I no longer buy Kenwood gear.

1199. FO-20 digital mode active

Newsgroup: rec.ham-radio
Date: 1990-02-21 06:04:29 UTC
From: brian@ucsd.Edu
Message-ID: <11879@ucsd.Edu>
Source record: 13253

A friend advised me that the new Japanese ham radio satellite FO-20 had had its on-board BBS activated, so I tuned it in and here's what I saw during one pass this evening.

I don't know much more about this than what you see here, but I thought I'd share the session to get more people interested.

Equipment used to receive this was the TAPR PSK modem kit attached to my R-7000, and a 30-element circularly-polarized beam. The TNC was an MFJ 1270 with the PSK modem plugged into it. 435.910 is the downlink freq, +/- 9kHz of doppler locally. I'm told that this modem does the special Manchester-encoded AFSK needed to uplink, but I haven't tried that yet.

Anyway, here's what one pass looked like:
- Brian

1200. Re: Questions about FCC NPRMs

Newsgroup: rec.ham-radio
Date: 1990-02-21 06:15:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500420@ux1.cso.uiuc.edu>
Source record: 13254

> I have been waiting to see just what the FCC really said regarding
> the proposed codeless class license. Since I have never followed
> NPRMs very closely before, I wonder if some of you could answer
> a few questions.
>
> 1. How long does it usually take for the summary of the NPRM to reach
> the Federal Register? I have not seen it in issues up through 2/12/90.

It usually takes a few days at least. I have seen things take more than
a week to make it into the FR.

> 2. How detailed is the summary of the NPRM published in the Federal
> Register? Does it describe the exact changes proposed to part 97,
> or will it be a general statement such as the press release posted
> to the net earlier?

It is usually plenty detailed for our purposes. It is better than a press
release.

> 3. How does the "complete text" of the NPRM differ from the summary?
> Would it be worthwhile to order the "complete text" of the NPRM
> from the Commission's copy contractor? Have any of you ever
> done this?

It may or may not be worth it to you. The complete text contains all the
material prepared by the staff, and often includes many referenced items.

I did order the complete text and original petitions for 87-14 from the copy
contractor. It was useful info at the time, but I doubt if I will need it
for 90-55.

1202. Re: Devil in CW

Newsgroup: rec.ham-radio
Date: 1990-02-21 07:34:08 UTC
From: karn@ka9q.bellcore.com
Message-ID: <20160@bellcore.bellcore.com>
Source record: 13256

In article <1681@aurora.AthabascaU.CA> lyndon@cs.AthabascaU.CA (Lyndon Nerenberg) writes:
>And considering that hardly anyone builds their own gear any more,
>I think the very idea that someone "needs" the electronic skills to
>pass the technical portion of the exam to be granted an EXTRA is
>old-age thinking.

Lyndon, we've discussed this point in the past. The fallacy in the "so, why not a no-theory license?" argument is the following:

Yes, it's certainly possible to operate a modern radio with very little knowledge of electronic theory. Hundreds of thousands of cops, firemen, security guards, mobile phone users, etc, prove this every day.

But the real question is whether one would be able to contribute to the basis and purpose of the amateur service without some knowledge of electronic theory. I certainly don't want to dismiss the public-service aspects of amateur radio, but it's clear to me that amateur radio's real payoff to society is on the technical side. Not in the direct "spin-off" aspects (though they do exist) but rather in the opportunity that amateur radio gives people to learn about electronics and communications and to encourage them to apply their skills to a socially useful career.

Phil

1203. Re: No code and Chaos Band

Newsgroup: rec.ham-radio
Date: 1990-02-21 08:18:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500422@ux1.cso.uiuc.edu>
Source record: 13257

Maybe we should include on the theory test, lots of questions on direction finding. Then we have hams who are afraid they might be found, and hams who can do the finding. We don't do this anywhere near as much as we should.

1204. Update on WEBER picture format

Newsgroup: rec.ham-radio
Date: 1990-02-21 12:41:13 UTC
From: gopstein@soleil.UUCP
Message-ID: <961@soleil.UUCP>
Source record: 13259

Several people who have additional information about the WEBER picture format have let me know that there are a few errors in my original posting. Most importantly, the data is not RGB. It is just straight color NTSC sampled at three times the color burst frequency. It is theoretically possible to separate the chroma information from the luminance, but it's going to take some effort.

Secondly, it seems that even-numbered frames are occasionally transmitted. I'm still trying to figure out when. It's difficult to get a lot of data to analyze since the passes are so short and during the week I miss the morning passes.

In the future I will not post the sources to rec.ham-radio since it gets automatically forwarded to INFO-HAMS. I'll post to one of the usenet source newsgroups and send a note to rec.ham-radio.

Is there anyone out there who is presently using a Kenwood TS-440s and
any of the newer TNC/TU's like a KAM or PK-232 ? I'm considering various
hookup schemes and was wondering how you are doing it. Are you going in
the AFSK ports on the back or are you using ACC-2 ? Are you muting the mike
on the back connector etc. Any help would be appreciated. I hope to be
up on all mode HF soon.
Thanks

1206. Nocode

Newsgroup: rec.ham-radio
Date: 1990-02-21 15:34:14 UTC
From: jimv@hienergy.East.Sun.COM
Message-ID: <1606@east.East.Sun.COM>
Source record: 13265

<<<< WARNING: Nocode opinion follows.... >>>>

I had promised myself that I wouldn't add to the noise on the nocode issue, but I've got to make one point: I am against the nocode proposal, but not because I think the CW test is a great screen, but it's the only one that exists at present. We have a written test scheme in which all the answers are printed in a book. Our tests are not tests of technical knowledge, they are tests of memorization ability only (short term memory at that). When I ask folks who are preparing for an upgrade exam if their intent is to understand the material or to "pass the test", the answer is always "pass the test of course". It's pretty sad when we have extra class licensees who don't understand even ohm's law, but they can (or could) tell you what the answers on the test were though. I for one, am very concerned what the final outcome will be if we eliminate the code requirement and still print all the answers in the manuals. I can only support a nocode proposal if it includes new written exams that are at least *somewhat* technically challenging. Maybe I'm paranoid, but when I listen to those guys on 27.405 to 28.000 (the "freeband"), I wonder how hard it will be for them to memorize a few answers...

1208. Re: Broadcasting Video from RC Plane

Newsgroup: rec.ham-radio
Date: 1990-02-21 16:05:04 UTC
From: music@hpfcmgw.HP.COM
Message-ID: <1690049@hpfcmgw.HP.COM>
Source record: 13262

/ hpfcmgw:rec.ham-radio / jokim@jarthur.Claremont.EDU (John H. Kim) / 12:28 pm Feb 19, 1990 /

Recently, on TV, I saw someone using a radio controled (RC) airplane with a video camera mounted on it. ..... I came up with what I think is a rather innovative use for this (well if you must know, as a spotter plane for deep sea fishing-- .... etc...

--
John H. Kim | (This space to be filled when I
jokim@jarthur.Claremont.edu | think of something very clever
uunet!muddcs!jarthur!jokim | to use as a disclaimer)

My question is.... if you are a few miles out to sea, where ya gonna take off and land. And what happens if and when the plane engine qiuts and it is quite far away from the boat. You'll get tired of tossing about $1-$2 kbucks in the ocean every so often.

A friend of mine has a 'copter and I figured out that we could use one of the CCD video chips and all the support electronics stuff.
I thought that a modified UHF tuner pack (one of those old kind with all the open air tuning caps) could be fixed up for about 75 milliwatts at ~600 mhz. We could FM the signal out and have the appropriate demodulator at the recieving end (sattelite tuner section). All this stuff, lense, video electronics, uhf transmitter, and battery would weigh about 2 pounds.

That's a lot of weight for a small aircraft to lift. So that means that to get any type of performance, we'd need a larger 'copter. That's ok but a fully loaded 'copter will cost a lot of money. Fixed wing craft that isn't used for aerobatics is another situation.

It was only an idea, but it would have worked.

As far as being leagel.... well.... the emission was within the 100 miliwatt power requirements for liscense free operation, at the time.
I think that the current spec may be a radiated emission of within 10,000 microvolts field streingth at 1 meter.
(Right, like everyone is going to figure out how to measure this).
The frequency and details of transmission didn't matter here in Coloradio since there is little UHF TV activity and we wouldn't have interfered.

As far as a liscense is concerned, you don't don't need one for low power transmitters (less than 1/10th of a watt). However, this power level may not suit your needs and since you will probabily want to go with, say 5 watts of power to get any kind of range on the transmitter, and since this is

going to be used for commercial fishing (you will get paid for supplying information) you are looking at another can of worms altogether. A ham liscense won't allow you to use your radio communication for profit or gain.

'Nuff from me for now

John Wells (WA0LHB) in Ft. Fun, Coloradio

1209. WEBER Picture Format

Newsgroup: rec.ham-radio
Date: 1990-02-21 16:05:38 UTC

(Netnews bombed, so I am sending these out together again!)

Rich:

One more error you made, ALL lines are sent, you have just been unlucky and have missed those times when the passes were transmitting the lines. Once again, ALL lines are transmitted. I wondered why your weber.ps looked so flat ;-). At any rate, an outstanding job. Amateur inventiveness never ceases to amaze me. That is what these satellite projects are all about.

DEVON: Just average four pixels and use four color representation. To bad there is no good black and white on the commodore but you can always use a B&w TV. A two level representation is not gonna get it, so give up the resolution for another two levels.

Rich and others:

OUTSTANDING. You've got it almost completely correct. Your one error is in the red green blue bit. Notice from your photo that the beginning is the sync. AT the end of the line is the colorburst. This is a straight NTSC picture that has been digitized by a board that fires on the vertical sync. The picture you have put up as a postscript file is WEBER Photo-9 and is picture of the limb of the earth. The satellite is still spinning down and even though it takes only a 30-th of a second for a NTSC frame, how many of you have tried hand holding a camera for a 30-th of a second still shot? As the bird slows down and locks magnetically (the rest of them have just done this and WEBER has greater moments of inertia and more mass to despin and lock), the pix should not smear as this one has. In your Postscript photo, any detail was washed by this spinning other than the atmosphere along the earth's limb is clearly visible. You should see it in color ;-). Soon, soon. Rich, I will post the color decoding formulas so that you can do a little trigonometry and recover the color information. The lines are NOT sent alternately RGB, it is NTSC (Bleeccchhhh!).

Great work!!!

Bob

P.S. Weber FINALLY published the protocol yesterday (thanks Rich, it was in response to your work). If it doesn't show up here today, I will post it tommorrow. I forgot it this morning (late to work, thanks to Microsat passes!)

1210. Ham Radio "Filters" other than CW

Newsgroup: rec.ham-radio
Date: 1990-02-21 16:35:03 UTC
From: DEFRANCO@TOPS20.RADC.AF.MIL
Message-ID: <12568150935.9.DEFRANCO@TOPS20.RADC.AF.MIL>
Source record: 13263

I'm sure we're all geting tired of the same repetitive arguments over code vs no-code, especially with the FCC Proposal in the open now. Two points keep rising to the top:

1) CW acts as a filter to keep out the "undesirables" who would turn ham radio into another CB world. Bullshit. What WILL keep them out, if anything can, is that ham equipment generally costs a lot more than CB gear. What created the big rush to CB was the popularization during the 70's by TV shows and songs like "Convoy". Every wanted to run right out and prove that they could be just as "country" as the next guy. I put a CB rig in my car as I did a lot of travelling at the time, and I wanted emergency communications available, and it was CHEAP. For $60.00, I was up. Of course, the thing was almost always useless because of the incredibly low signal/intelligence ratio.
As long as ham gear costs more than CB gear, we have little to fear. Besides, no one is seriously proposing elimination of all testing requirements, or even for code to acces HF bands.
Off the wall question: Where did -13- WPM come from? It's an unusual number for speed in a decimally oriented society (or are we, given 12 in/ft, 3ft/yd, etc.) Why not 5 WPM, 10 WPM, and 20WPM, (assuming a requirement)?

2) The FCC will turn against hams if we fight to no-code license and take away our allocations. Several people asked for some reference to FCC policy. I don't have the archives handy, but several months ago, when no-code was hot and heavy, there were quotes taken from the former FCC chairman that put forth that position rather explicitly. I believe either Phil Karn or Phil Howard might remember it.
What is important to remember is that useable spectrum is finite, and the FCC is faced with a growing demand for access to it. Given the general Government position to favor business over the private citizen, the FCC will tend to reallocate the RF space based on those priorities, regardless of how much the Amateur Radio world screams. Witness the reallocation of 220 MHz space.

I do not propose to cheapen the hobby by opening up ham bands to CB'ers as the doomsayers predict, but I do propose to take a more realistic look at how Amateur Radio fits into the "grand scheme" of things. The more parochial the ham community acts, the more we will be perceived as anachronisms whose loss will be mourned by few.

Carl DeFranco

I do not know if this is the correct newsgroup to post this article. But not finding any newsgroup seems to be directly relevent I am posting it here.

I want to know what will be the maximum sweep of longitudinal degrees that a satellite dish located in Fargo (appr 96W 47N) will be. I have a list of satellites (from WRTH) and some information about their transponders. I would like to know which of those satellites can be accessed. Any help will be greatly appreciated.

Thank you in advance

So, is there a College Ham club at University of Wisconsin / Oshkosh?
Or are they all members of Fox River Valley ARC?

I am a pilot and will be in Oshkosh this summer for the annual
Experimental Aircraft Association meet July 27 - August 2. I would like
a list of the local repeaters (published in the repeater directory or
not) and access to the local phone patch for that week.

Assuming this actually reaches someone at UW/Oshkosh, I am also looking
for a motorcycle or moped to rent for that week. We are flying in and
staying at Gruenhagen for the week and don't want a car (too much hassle
parking). I can demonstrate insurance and 20 years of motorcycle
proficiency (and maybe trade an airplane ride?).

Please mail to me and I'll post a summary.

Well, I was at a party the other night, and I was talking with some guy I had just met. The conversation turned to hobbies, and I mentioned that I was an amateur radio operator. It turns out he was, too (I think his call might have been K8TUR, but I don't know for certain). Anyways, I went off into my usual long-winded griping about how we're going to lose the 900 MHz band to commercial interests, particularly the cellular phone industry. It turns out that this guy hadn't operated in years as an amateur. And he worked in the cellular phone business to boot! Oops! He was quite defensive of my blasting at the commercial service. Heh!

Speaking of university clubs ...

The University of Texas at Austin ARC, W5EHM (W5 Echo [Hotel|Hike] Motel)
as it exists today came about sometime in the 1950's. Although the club
doesn't sport the tradition of a W8LT, W1XM/W1MX or W2SZ, it's been working
at developing a legacy of its own. The focal point of club activities
is operating both modes of the ARRL November Sweepstakes. The UT-Austin
club is always gunning for national recognition by earning a spot in the
MultiOperator Top Ten. Sometimes they make it, sometimes they don't.

Nonetheless, the W5EHM club counts among its alumni a motley collection
of Sweepstakes enthusiasts who have learned what a great club activity
an SS effort can be.

I am curious about this statement, ie test is only that
of memorization. One data point, a guy I work with here, passed
his general first shot. He did not memorize the questions. Is
it the case that the various courses actually set out and train
people to understand the material or to just memorize? Or is
the material hard enough that the average guy cannot absorb it and
thus the courses evolve to the least common denominator?

Excuse me? Either it exists or it doesn't. Don't be such a bigot.

I just phoned the Dep't of Communications. They don't have a
breakdown by certificate type available, however I going to
contact the licensing branch in Ottawa and put in a request
that they scan the license database and give me exact numbers.

Of course, all of this is moot, since all the digital certificate
holders grandfather into "advanced" status when the new licensing
system takes effect this fall.

[This means that current digital holders will inherit full HF
privs - all modes - and will be able to operate CW (GASP!)
without having to take THE DREADED MORSE TEST! I think you're
going to see a LOT of people writing the digital exam over the
summer :-)]

>>Or have you been sorry you didn't have a USA warranty etc. I have
>>contacts in Japan so getting the radio is no problem. I'm just wondering if
>>it's more hassle than the money savings is worth.

Just a comment on buying from Japan in general...

I was interested in buying a camera outfit and many suggested that mail-order
was the way to go. I got myself a copy of a photographic magazine and the
mail-order vendors listed in the back had prices that no one around here (OH)
could come close to. What I didn't realize at the onset was that those prices
were for Japanese goods. In other words, there was no U.S. warranty on it.
I was looking at Canon equipment. I found out that Canon has a subsidiary
called U.S. Canon that does better (at least more!) quality control and
maintains the warranty program. When comparing U.S. Canon prices (i.e. that
contained a U.S. warranty) I found that their prices were still better although
not anywhere as significantly better as Canon's. The warranty and cost of
quality control made the difference.

My personal opinion is: Warranties are like insurance; you don't need them...
until you need them. If you feel that you can live without the insurance
then ordering direct is the best way to go. I went with the U.S. warranty.

I don't think it's a matter of "cannot absorb" it, I think it's a matter of the fastest way to meet your goal. If your goal is to simply "pass the test", then the fatest way to accomplish that it to memorize the questions and the answers. I think the ARRL manuals are pretty well written such that if even non-technical folks took the time to read and study them in order, they could easily understand the material and pass a fair test on that material. As long as we continue to print the question pools and the answers, there will always be an easier way out. I've talked to several folks who have never read any part of the license manuals other than the question pools. I don't see how taking away the code requirement and not "fixing" the written tests will benefit amateur radio. Sheer numbers cannot be the answer to everything that is wrong with our hobby.

I seems that there are a number of people who think the theory test for an amateur license is too hard. I must comment.

In March QST, concerning the number of violations noted by FCC during the Buovet DXpedition, FCC is quoted as saying:

"..... these violations appear to have resulted from misuse of increasingly complex amateur service equipment rather than any willful action....."

So, it would seem, we have among our ranks a number of LICENSED people who aren't even smart enough to be appliance operators.

Any comments? No code is fine with me, but as I understand it, the CB service was created for people who don't know or care about electronic theory, and just want to plug it in and blabber.

Well, yes and no - we have a no-code class; I wouldn't say it was for the masses. You have to undestand Shannon & Nyquist and queuing theory & modulation schemes and Advanced-class electronics. It's not a CB license. There is the usual regs and operating procedures section - Q codes, & c. & c. as well. 150 multiple choice + 3 hour essay format exam. Not _entirely_ trivial :-).

As for HF privileges and the ever-so-precious CW :-) part, Digital Class ticket holders (i.e., myself) don't have priv's below 144 Mhz. You're safe :-). Although I see by ve6bbm's note that I'm to be grandfathered in to Advanced Class when they rejig the classes this fall, I'm not so sure that I'll be running out to buy/build an HF rig just right away. There's a _lot_ of stuff I want to do on 440 and up first.

>Seems like the ones not supporting the idea of FSF are the ones that have a
>vested interest in maintaining the status quo.

It also seems that many of the people that do support the idea of the FSF are those that haven't contributed. Compare the number of products offered by the FSF to the number of people that "support" them and you'll see strong evidence that this is true.

I've made and continue to make contributions to the FSF but I very much disagree with many of the ideals held by the FSF and RMS in particular. It's my opinion that they often impede the progress of free software. I very much prefer the lack of red tape involved in most ham related software. Phil's code is a wonderful example.

So why do I still contribute? Well, in all the cases thus far, I've decided that they could best distribute the code and that they have played a positive roll in the project. If the day comes that I find this to not be true either due to political change or the nature of the project, I will have no problem with not contributing. Contributing is certainly not a reflex. Religion can be a dangerous thing.

What's this got to do with ham radio? Nothing at all. Just a hot spot for me.

Devon

ARRL Letter - February 14, 1990 - Volume 9, Number 3 - Page 1 of 3

FCC PROPOSES TO ADD COMMUNICATOR
SIMPLIFY LICENSE STRUCTURE IN PR DOCKET 90-55

On February 8, the FCC decided to propose a codeless class of amateur operator license called Communicator. The Communicator Class would be incorporated into a licensing structure containing four ascending classes: Communicator, General, Advanced, and Amateur Extra. Current Novice and Technician Class licensees would be grandfathered indefinitely but no new licenses for those classes would be issued.

According to the FCC news release announcing this decision, the Communicator Class license would satisfy three major objectives. First, to offer an entry level license for all persons who find telegraphy a barrier to pursuing the purpose of the amateur service. Second, to design a codeless license that can easily be implemented into the current licensing process. Third, to avoid any negative effect upon current licensees, the volunteer examiners who administer amateur examinations, or the Commission's workload.

It appears that the FCC is proposing two versions of the Communicator Class. The first would not require knowledge of Morse code. The "codeless Communicator" would be permitted to operate on the 220 MHz and higher amateur bands. A Communicator Class licensee passing or receiving credit for a telegraphy examination would be authorized the privileges of the current Technician Class. Applicants for the new Communicator Class would be required to pass a 60 question written examination comprised of questions from the two pools currently used in the Novice and Technician license examinations as well as additional new questions.

The proposed transmitter power for the Communicator Class is 200 watts PEP. All emission types would be permitted. Call signs for Communicators would be issued from Group D.

Upon initial review, ARRL Executive Vice President David Sumner, K1ZZ, commented "The FCC proposal differs in one very major respect from the League's petition, RM-6995: the Commission proposes to stop issuing Novice licenses so that the one point of entry into Amateur Radio would be Communicator. This differs substantially in philosophy from what we have envisioned.

"While the League will not have an official position on the FCC proposal until one is adopted by the Executive Committee or the Board, it is fair to say that we have long placed great importance on the retention of the Novice license as a means of entry into Amateur Radio. It would not be overstating the past and present League position to say that retention of the Novice license is deemed absolutely essential." However, Sumner cautioned that amateurs should wait until they have an opportunity to study the Notice of Proposed Rulemaking before forming opinions on the Commission's proposal. The NPRM is to be released in about two weeks.

The Commission is requesting comments on all aspects of this proposal. There will be a comment period of six months, beginning on the date it is published in the Federal Register. This will be followed by a one month period for reply comments.

FUJI OSCAR 20 TAKES TO THE AIR AND THE AIRWAVES

JAS-1B (Fuji OSCAR 20) was successfully launched on February 7 at 0133 UTC from Tanegashima Space Center in Japan. In a congratulatory message to JARL President Shozo Hara, JA1AN, ARRL President Larry Price, W4RA, said "This second amateur satellite in the Fuji series is an important additional resource for Amateur Radio. It will be extremely useful for both day to day and disaster communications."

Like its predecessor, FO-12, JAS-1B is a space-borne digital store-and-forward packet BBS using mode JD. It also carries a Mode JA linear transponder for SSB communication.

The mailbox feature requires a PSK modem and a TNC-2 using AX.25 link level protocol at 1200 baud. There are two downlink telemetry beacons on JAS-1B. The first one is for Mode JA at 435.795 MHz. It sends CW or PSK with an output power of 100 mW. The second telemetry beacon is a Mode JD beacon and has a downlink frequency of 435.910 MHz. The Mode JD beacon sends PSK packets and has an output power of 1 Watt.

Additional technical information on Fuji OSCAR 20 can be found in the September 89 issue of QEX.

RFI CASE DISMISSED IN WASHINGTON SUPERIOR COURT

The RFI nuisance case of Luedke and Abigando v Hudson has been dismissed by the Superior Court of the state of Washington. The case is one of the few recent cases in which a nuisance complaint was dismissed by the court for lack of jurisdiction. The court stated that only the FCC has exclusive jurisdiction over cases involving RFI.

The case involved Dr. Wayne Hudson, KT7G, a resident of King County, Washington, and his two neighbors, Messrs. Luedke and Abigando. After an initial complaint of RFI by his neighbors, Hudson had his station inspected by the FCC and a private firm. His equipment was found to be in operating accordance with FCC rules. The RFI problems, however, continued and his neighbors took him to small claims court. The court ruled in Hudson's favor

when it was determined that his neighbors touch lamps were the actual cause of the RFI.

Not satisfied, Luedke and Abigando took their case to Washington State Superior Court. The Superior Court determined that "The Supremacy Clause of the United States Constitution bars the instant state law claims ... since RFI problems are within the exclusive jurisdiction of the FCC preempting any state laws to the contrary..." In addition, the court determined that the neighbors had not taken steps to solve their own RFI problems as requested by the FCC.

Hudson's neighbors also sought an injunction on the basis of aesthetics saying that his antennas were unsightly. The court responded by saying that aesthetic impact is not a ground for injunctive relief. It concluded by reaffirming that the court's jurisdiction is preempted by federal law and that the FCC has exclusive jurisdiction over RFI problems.

6 METER REPEATER SUBBAND EXPANDED

The FCC has expanded the 6 meter repeater subband from 52-54 MHz to 51-54 MHz effective April 9,1990, according to a Report and Order dated February 1. The FCC stated that this expansion will permit operation of additional repeaters to meet the increased demand.

Although supportive in its comments to the FCC, the ARRL agreed with commenters concerned about interference to stations operating in the Pacific DX window. Protection of these operations will be afforded through amendment of the voluntary band plans.

Section 97.205(b) is revised to read as follows: 97.205 Repeater station.

(b) * * * A repeater station may receive and transmit only on the 10 m and shorter wavelength frequency bands except the 28.0-29.5 MHz, 50.0-51.0 MHz, 144.0-144.5 MHz, 145.5-146.0 MHz, 220.0-220.5 MHz, 431.0-433.0 MHz and 435.0-438.0 MHz segments.

FCC SAYS "NO" TO FM 2 -- AGAIN

A year ago, a company called Radio New Jersey (RNJ) filed a petition with FCC seeking reallocation of the 50-54 MHz amateur band to a new FM broadcast service. Radio New Jersey, whose principal is Lawrence J. Tighe, Jr., K2JIA, is the licensee of a daytime only AM station in Hackettstown, NJ. Tighe's apparent motive in seeking a new broadcast band is to gain a full time outlet for his broadcast station.

The FCC Chief Engineer dismissed the RNJ petition less than six weeks after it was filed, without even assigning it an RM number, on the grounds that it had failed to consider the impact of the proposal on amateur radio communications, both domestically and internationally. RNJ petitioned for reconsideration, which was, which was denied. Finally, RNJ went to the full Commission to appeal the action of the Chief Engineer.

On January 18, the Commission affirmed the Chief Engineer's findings. An Order released January 25 says in part: "In particular, the petitioner has

not provided a satisfactory demonstration that amateur operations at 50-54 MHz could be accommodated elsewhere in the spectrum or that broadcast operations in this band would not cause interference to international amateur communications."

HF OPS -- WATCH THOSE VFO SPLITS

The FCC has issued over 240 notices of violation to amateur stations for improper operation during the recent 3Y5X Bouvet Island Dx-pedition. The notices were sent to US amateurs operating voice on frequencies reserved in this country for digital transmissions such as CW and RTTY. This is in violation of section 97.305(c) of the FCC rules which partitions various HF amateur bands.

FCC believes that most of the violations resulted from "misuse of increasingly complex amateur service equipment rather than any willful action" but reminds amateurs that: the station licensee is responsible for the proper operation of the station and will be held responsible for the transmission of an unauthorized emission under Section 97.103 of the Rules. Operation during the 3Y5X expedition is the subject of the March QST editorial.

ARRL Letter - February 14, 1990 - Volume 9, Number 3 - Page 3 of 3

HONORARY ARRL VICE PRESIDENT JOHN GRIGGS, W6KW, SK

John R. Griggs became a Silent Key on January 6, 1990. He was ARRL Southwestern Division Director for 18 years from 1949- 1954 and from 1967 to 1978. John was named as an ARRL Honorary Vice President in 1980 and served in that position until his death. A resident of Los Osos, California, he spend most of his life in Southern California.

First licensed in 1922 at the age of 15, John designed and build commercial radio transmitters. He also designed radio equipment for the Admiral Byrd expedition to Antarctica in 1940. During World War II, John served as a radar field engineer attached to the Pacific Fleet. In the following years, he designed avionics and communication equipment. John Griggs will certainly be missed by the amateur community. Contributions in his memory may be made to the ARRL Foundation.

THIRD PARTY AGREEMENT COUNTRIES LIST

Section 97.115 of FCC Rules ...authorizes an amateur station licensed by the FCC to transmit messages for a third party to any amateur station within the jurisdiction of a foreign government whose administration has made arrangements with the United States to allow amateur stations to be used for transmitting international communications on behalf of third parties.

Here are the countries that have made the necessary arrangements with the US to permit third-party messages (recently added countries are highlighted): Antigua and Barbuda, Argentina, Australia, Belize, Bolivia, Brazil, Canada, Chile, Colombia, Federal Islamic Republic of Comoros, Costa

Rica, Cuba, Dominica, Dominican Republic, Ecuador, El Salvador, The Gambia, Ghana, Grenada, Guatemala, Guyana, Haiti, Honduras, Israel, Jamaica, Jordan, Liberia, Mexico, Federated States of Micronesia, Nicaragua, Panama, Paraguay, Peru, St. Christopher and Nevis, St. Lucia, St. Vincent and the Grenadines, Sierra Leone, Swaziland, Trinidad and Tobago, United Kingdom (special event stations with call sign prefix GB followed by a number other than 3), Uruguay, and Venezuela.

United Nations stations 4U1ITU in Geneva, Switzerland and 4U1VIC in Vienna, Austria, have also made arrangements with the US to permit third-party communications.

No amateur station regulated by the FCC shall transmit messages for a third party to any stations within the jurisdiction of any foreign government not listed above. This prohibition does not apply to a message for any third party who is eligible to be the control operator of the station.

ATTENTION YOUNG ARTISTS

If you are between the ages of 8 and 18 and have an interest in electronics, we'd like to showcase your artistic talent and originality. The ARRL is sponsoring a national art contest with the theme "Youth in Amateur Radio." Winning entries will run in QST. Some entries will also be forwarded to the "Youth in the Electronic Age" worldwide contest sponsored by the International Telecommunication Union in Geneva, Switzerland.

For a copy of the rules, send an SASE to ARRL, Educational Activities Branch, 225 Main St, Newington, CT 06111. The deadline is April 15, 1990, so contact us right now!

CALL FOR PAPERS

Papers are invited for presentation at the ARRL 1990 Educational Workshop scheduled for Saturday, June 9, at the ARRL National Convention in Kansas City, Missouri. Topics include all aspects of Amateur Radio recruiting and instruction such as: one- on-one tutoring, motivational techniques, Public Relations ideas, and working with seniors, the disabled and youths. Prospective speakers please ask Educational Coordinator Rosalie White, WA1STO, at ARRL HQ for an author's kit. Camera ready papers are due at ARRL HQ by April 27, 1990.

GATEWAY: The ARRL Packet-Radio Newsletter - PART 1 OF 2
Volume 6 - Number 11 - February 16, 1990

Published by: The American Radio Relay League
225 Main Street, Newington, CT 06111

Stan Horzepa, - WA1LOU Editor

JAPANESE HAM SATELLITE LAUNCHED

Hot on the heels of the successful launch of six Amateur Radio satellites in late January, the JARL announced the successful launch of their new ham satellite, JAS-1b/Fuji-OSCAR-20 (FO-20), on February 7 from the Tanegashima Space Center. FO-20 will function as a PBBS using mode JD (145-MHz uplink, 435-MHz downlink). A one-watt telemetry beacon will transmit PSK packets on 435.910 MHz. To use the PBBS or to monitor telemetry, users will have to attach a 1200-baud PSK modem to a TNC 2.

HELP SOUGHT FINDING U0-15

Following the last reported reception of signals from U0-15 at around 05:00 UTC on January 23, nothing has been heard from the satellite despite continued attempts by the University of Surrey (UoS) engineering team to activate redundant on-board systems.

While UoS will continue to explore redundant paths and configurations available on the satellite, the time has come to investigate whether the spacecraft has suffered a major malfunction. It should be possible to resolve this question by listening for residual signals from the on-board local oscillators (to confirm the operation of the power systems) and any very low-level signals at the nominal downlink frequency (indicating a transmitter or antenna problem). If signals from either the local oscillators or the transmitter can be detected, then there are several tests that can be done to trace the nature and extent of the problem.

UoS would be most appreciative of any assistance in the above listening tests. The level of local oscillator signals present at the spacecraft antenna were measured before launch to be -60 dBm. Examination of the link associated with the above experiments indicates that large antennas and sensitive narrow- band receivers operating in the 132-136 MHz (local

oscillators) and 435.120 MHz (downlink transmitter) will be required to stand any chance of success. It is recommended that tests first confirm the detection of local oscillator signals from the operational U0-14 before attempting to listen for U0-15.

It is also very important that we narrow the window between the last reported reception of U0-15 at 05:00 UTC on January 23 and first AOS (or lack thereof) at UoS at 10:00 UTC the same morning. Was anyone else listening? Telemetry would be ideal, but even a report of the presence of a signal from UO-15 on 435.120 MHz would help enormously.

If anyone can help or suggest contacts who may be able to help, please contact Martin Sweeting, G3YJO, at UoSAT.

GATEWAY: The ARRL Packet-Radio Newsletter - PART 2 OF 2
Volume 6 - Number 11 - February 16, 1990

GATEWAY TO MERGE WITH QEX

To better serve our growing number of experimenters and packet- radio enthusiasts, Gateway, the ARRL Packet-Radio Newsletter will cease to be published on a biweekly schedule and will be merged into QEX, the ARRL's monthly "experimenters' exchange." Aside from receiving the latest packet-radio news, you will now receive timely articles about packet-radio experimentation and will be kept up-to-date on the latest technical advances in all aspects of Amateur Radio.

After five and a half years of biweekly publication, this is the last issue of Gateway, the newsletter. Gateway subscribers will receive the first expanded issue of QEX in March and monthly thereafter. Gateway subscriptions will be prorated on a two-for-one basis, ie, for every two issues of Gateway remaining on your subscription, you will receive one issue of QEX. Gateway subscribers who already subscribe to QEX will have their current QEX subscriptions extended on the two-for-one basis.

GOING... GOING... But Not Gone

It has been a ton of fun and hard work serving as editor of this newsletter for the past two and a half-years and I hope you have enjoyed the effort. I wish to thank all of you who have contributed to the newsletter in the past and hope that you will continue to contribute to Gateway in its QEX guise. I also wish to thank Lori "Maty" Weinberg of ARRL headquarters who has served as chief cook and bottle-washer of the newsletter ever since I came on board. Without Maty, you would not be reading this.

In conclusion, although my job of newsletter editor is ending, you aren't rid of me yet, as I will be conducting the Gateway section of QEX. So, see you in March QEX. - Stan Horzepa, WA1LOU

GATEWAY CONTRIBUTIONS

Submissions for publication in Gateway are still welcome. You may submit material via the US mail to:

Gateway
Stan Horzepa, WA1LOU
75 Kreger Drive
Wolcott, CT 06716-2702

or electronically, via CompuServe to user ID 70645,247 or via Internet to 70645.247@compuserve.com. Via telephone, your editor can be reached on evenings and weekends at 203-879-1348 and he can switch a modem on line to receive text at 300, 1200 or 2400 bit/s. (Personal messages may be sent to your Gateway editor via packet radio to WA1LOU @ N1DCS.)

The deadline for each installment of Gateway is the 14th of the month preceding the issue date of QEX.

REPRODUCTION OF GATEWAY MATERIAL

Material may be excerpted from Gateway without prior permission, provided that the original contributor is credited and Gateway is identified as the source.

You don't want to dismiss the public service aspects of amateur radio?
You just did.

Go back and look at the basis and purpose. Public service is prminently
mentioned. It's also the only way the general public will ever hear
about amateur radio doing something good for them.

Yes, we need the techies - but we need the non-techies who want to serve
the public just as much. This should not be/become a "nerds only"
service.

I called the PENNDOT folks over in Harrisburg and got the scoop for PA residents. There is a $20 one time fee to have the plates made. You have to already have regular plates when you order the ham ones. When your ham plates arrive you have to return the old plates. If you upgrade during the first year you are out of luck. An individual is only permited to order one ham tag per year. There is no provision for more than one car either.

>then the fatest way to accomplish that it to memorize the questions and
>the answers.
>[...]
>As long as we continue to print the question pools and the answers, there
>will always be an easier way out.

Many (most?) of the questions on the exams are questions whose answers MUST be memorized. Band edges, operating practice and regulations cannot be derived. The number of scan lines in an SSTV image must be memorized. The data rates commonly used in FAX have to be memorized (these are questions in the exams.)

Perhaps the problem is not that memorization is possible, but that there are so many questions that REQUIRE memorization. I haven't done an analysis of it, but it's probably possible to ditch all the questions whose answers can/should be derived and still pass many of the exams.

Publishing the answers to the pool is not a problem... anyone who has memorized the answers to 400 questions for a 20 question exam has shown more commitment to amateur radio than people who have learned 20wpm code. Certainly it seems like "the hard way" to me to memorize a few hundred answers instead of a handful of equations (that's why I did it the easy way...learn the material.)

If there is any real reason why people should be memorizing the equations instead of the answers (we can always look the equations up if we need them, yes?) then probably the solution is not hiding the answers, but boosting the number of calculation questions and expanding the pool two or three times. Publishing the pool of questions and answers is a very common licensing technique and it helps keep the exam fair and open to public observation.

Just to point out that the British no-code license does actually allow the holders to transmit CW. This has been the case for some years.
I dont think anyone has mentioned this so far. Those people who wish to learn/use code should not be disbarred from doing so just because they hold a no-code license.
I dont bother to though. Like i dont bother to use semaphore.

>Phil

Yep, your right (although I mildly disagree with the implication that code isn't useful). The point is it takes a reasonable amount of *time and effort*. Working at something makes you value and respect it as such. If you advocate "giving away" licenses (I'm not saying you do BTW), then why have any tests at all? In my opinion the tests exist to filter those who have no interest in the technical aspects of the hobby. My point is that the current ARRL test structure DOES NOT do this. As I said, CW is the *wrong* filter, but it does require you to be pretty dedicated to the hobby. It's pretty hard to pick up a CW book and with only a few hours of memorization pass the test. As I said; eliminating the code requirement without fixing the written tests is a foolish and shortsighted exercise to obtain sheer numbers IMHO.

Phil, I would like to hear what you think the purpose of the written exams is and if you feel the current structure meets that purpose.

I received five replies to my request. In summary, here is the information
I received:

(1) You need a RS232 card with a free serial port, a TNC, and some sort of
a terminal emulator program. A TE-I cartridge (300 baud) or a TE-II (1200
baud) will work. And, of course, the radio.

(2) There were some reservations about the 40-column display; and also about
the SSSD disk memory system not being adequate for some uses.

No one mentioned any custom hardware so I assume that none exists. I checked
the Triton catalog and they don't have any uniquely packet hardware.

Looks like the 99/4A will work, so I'm going to dig mine out of the attic and
Looks like the 99/4A will work, so I'm going to dig mine out of the attic and
try to get it going again.

Thanks again to all respondents.

I tried a low-pass filter on the transmitter, too. Most gear is clean enough that harmonics from the transmitter usually isn't a problem. What can happen is that the strong RF fields can cause lotsa things (like rain gutters, corroded TV antennas, etc) to re-radiate a clean fundamental plus harmonics. Recall that metal-oxide (like galena) acts as a diode, and that diodes are non-linear devices. 10 meters gets into my electronics more than 15/20/40/80. I've never had problems on 40 and 80.

My VCR was a piece of RFI-prone junk. To solve the problem, I installed a hi-pass filter on the coax and choked the snot out of the incoming 120 VAC power. Your garage door opener could be picking up RF from either the AC lines or directly. Again, choke the snot out of all low frequency (DC-60Hz) lines that may be acting as antennas until the problem goes away.

I made the mistake once of transmitting on 2m with 40 watts. I burned up the receiver for the garage door - cost me $30 to replace it. You might want to move that sloper leg elsewhere.

Perry Scott

Re: Memorization

This discussion about memorization vs. REALLY KNOWING is pretty difficult
to resolve.

Tests are imperfect ways to measure things. Would you feel much better
knowing that Pilot's Licenses (including airline pilots) include
multiple-choice, memorizable tests?
Yes, there is a skills test in addition but it doesn't cover ALL
the material an ATP is responsible for. (It is somewhat similar
to the previous requirement to demonstrate the ability to send and
receive code.)

I memorized in order to pass Advanced at age 14. When I got to
EE in college, I found that I'd remembered more than I thought because
I could work through lab exercises that others could not purely because
of my ham radio experience.

Memorization is sometimes a first step and sometimes it's the last step.
Multiple choice tests are cheaper, faster and more consistent than
essay exams (like the ham exams of the 1920s).

What is the alternative proposal?

I need service information for the ICOM 701. ICOM claims that no service info exists, other than that written in Japanese :-(. I am particularily interested in data on troubleshooting the transmitter section (not functional at all in my rig) and peaking the receiver (very weak reception). Thanks in advance for any pointers.

I would also be interested in any information on the computer interface port.

>>>==>PStJTT KC1TD
Patrick St. Joseph Teahan Taber

Yes, I agree, the problem is both the content of the questions and the limited size of the question pool. When I say memorize, I mean they memorize the answer is "B" in many cases, not that the Novice voice band is 28.300 to 28.500! The ARRL takes the questions and answers in exact form and order. I think you'd be surprised how easy it is to memorize 200 answers without having a clue what they mean! (yes, using question pools is common and fair is done properly).

I *really* didn't mean to start this! I'll submit my views on the current proposal to the FCC and I urge others with an opinion to do the same.

YAP (Yet another point); a couple articles back someone stated that we should let "non-techies" in so they can do public service work. Excuse me, but isn't HAM radio about "techies", maybe I have the wrong hobby here....
I thought public service was an outgrowth of the technical side, not visa-versa!

>Both receivers cost the same at EEB.
>
>Any comments on this? Please email if this is not of general interest.
>Thanks.

While I'm not familiar with the specific two receivers, it is worth
remembering that the specs don't tell the entire story. There are specs which
can be used to get a raw feel for things like intermodulation resistance
and overall receiver quality, but the bottom line is really quite simple.

There is a Honda automobile ad running here in LA which features a young
woman test driving a new Honda. She stomps on the gas and squeals "Oooh, she's
quick". The salesman starts to comment about having the most horsepower, etc.,
and the woman cuts him off, saying "Oh, I don't want to hear about horsepower,
as long as she works".

Receiver audio quality, even useful dynamic range and sensitivity to
strong signal blocking are not easily reflected in specs. Some sharp filter
designs actually can degrade dynamic range. You need to actually use
these receivers to gain a real feel for which one is better or speak
to someone impartial who has used both. For what it is worth, I've heard
ICOM receivers are in general superior to Kenwood, but I several Kenwood
radios and no ICOM gear ;-)

It is a shame that this flight won't be during the normal school year
(for college, that is... at least, not here at Clemson). Anyway, has
there been any announcement of the frequency that will be used for the
SAREX packet station? Also, will any normal antenna system work (like
for the DOVE) or would a special one be needed (like a turnstile).

Newsgroups: rec.radio.shortwave
Subject: RADIO MOGADISHU QSL-POLICY
Date: 19 Feb 90 10:53:20 GMT

Hey folks,
would you like to PAY for QSLs? Some Finnish DXers have recently
received letters from Radio Mogadishu, Somalia, where this station
announces that if you want to get their QSL you must:
1. send them a tape;
2. pay $50 -- yes, fifty U.S. dollars! Furthermore, Radio Mogadishu
says that they will charge this money from your American Express.
No QSLs if these procedures are not followed!

Yeah... DXing is becoming an expensive hobby. Are there many who
have received this letter from Radio Mogadishu? Is this a exception
or a new tendency among radio stations in developing countries?

73 - Jorma Mantyla, Univ. of Tampere, Finland
tijoma@kielo.uta.fi

I think that asking $50 for a QSL is no longer DX'ing. That's extortion.

I read from the latest edition of the DSWCI's Shortwave News that a
Swedish DX'er had received a letter from a person from Radio Mogadishu
asking for help in escaping from that country! Apparently the letter
also included a QSL verification.

>Perhaps Radio Mogadishu's intent is to price the hobby out of the range
>of everyone but us filthy first-world capitalists :-).

Or perhaps it isn't Radio Mogadishu at all, but rather someone else
who has managed to come into possession of some letters directed at
them. With the proliferation of US Green Stamps included in QSL
requests, it's not an unknown thing for mail to go astray. My
understanding is that HCJB, for instance, claims that 30% of its
mail never makes it to the station. It seems more likely to me that
some enterprising local is trying to make a little hard cash than
that the radio station is trying to extort radio listeners. This
sort of thing seems to come up every few years or so....

>answers...

How hard is it to memorize a few answers? A few HUNDRED answers? After all you don't know WHICH test you will be given so you have to memorize the entire question pool. I would say that it's much easier to memorize a few dot-dash combinations than hundreds of answers to questions you don't understand. After all your "code" test now consists of answering ten multiple choice questions about a "typical" amateur contact you just copied. Write down the stupid dots and dashes and decipher enough of it to make a good guess at the right answers and you'll pass the stupid code. Of course you won't ever USE the code on the air so it doesn't matter. Seems to me that anyone who tunes the current hf activity and notes the many EXTRA class lids working out-of-band dx (heh heh) and wheezing into their over driven "linears" will realize that the sacred code acts as a potent filter to keep potentially good operators OFF the bands and lets in the trash.

We are trying to set up a couple of hams stations for student use at various locations. Being a government agency, we have a shot at equipment which has been surplused out by the feds (and state goverment as well).

However, since I don't keep up with the id numbers of surplus equipment, I'm somewhat at a loss when things like ARC-199U are listed (not a real number...).

Can anyone familiar with such things suggest good units to be looked for? Interest lies both in transmitter or transceiver units. Also in general coverage HF receivers, and also VHF/UHF units which might be useful for receiving things like weather satellite transmissions.

Please E-Mail me since we currently have a disk-space crisis and are not receiving rec.* groups (sigh....). I'll summarize and post back to the net if interesting info turns up.

Many Thanks & 73's

To: Sylvan.Katz@weyr.FIDONET.ORG

Hi Syl,
.
I have owned a TenTec Argonaut for about 15 years and am very pleased with it. I have had it camping, trailering, on business trips, to the cottage, to field day, contesting and general operating and never had a problem. It is compact light and versatile. The receiver is acceptable and you can work most stations even in crowded conditions on phone and even easier on CW. I have worked Easter Island on 20m SSB from a Halifax motel room using 2W PEP and a 57" whip. I also have a small MFJ tuner I use with it. I think it will tune the proverbial "wet string"<grin>.
.
As I said very dependable and easy to use. I would recommend some form of audio filter for crowded band conditions. It is easy to carry. I can pack a basic station (rig,pwr sply,tuner,key,mic,cables,log,and a portable antenna) into a gym bag (and have done so on occasion).
.
It is a good little rig and while costing more than the HW7/8/9 series, is worth it. I have also used the Kenwood low power versions of the TS120/130 and found it to be a super little radio too. Same features as the higher power model but 20 watts.
.
Hope it helps. Enjoy the UK, nice country.
.

1258. Fixing FCC NPRM 90-55

Newsgroup: rec.ham-radio
Date: 1990-02-23 10:41:00 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500424@ux1.cso.uiuc.edu>
Source record: 13313

The FCC's new license structure proposal, which involves more than just adding a new codeless license class as proposed by most petitions, has a number of deficiencies in it. I have put some time in analyzing possible changes of the proposal and have come up with a variation that has these advantages:

1. Uses only the four classes the FCC (apparently) wanted to have.
2. Incorporates TWO privilege levels for VHF-up.
3. All current privilege combinations may still be earned by future hams.
4. Grandfathering does not give away any HF privileges.
5. Retains a Novice entry level HF privilege set.
6. Preserves entire current HF privilege structure (not that I really want to, but it should be a separate issue).

The change I propose is to separate the Morse Code exam as an endorsement which will be required for HF privileges (in compliance with international requirements). The combination of the license class, and the level of the Morse Code endorsement will determine the HF privileges. Only the license class will determine the VHF privileges.

The chart below indicates what privileges you earn based on your license class and (if any) Morse Code endorsement. The letters have these meanings:

N = current Novice HF privileges L = limited VHF-up privileges
G = current General HF privileges F = full VHF-up privileges
A = current Advanced HF privileges
E = current Extra HF privileges

```
Morse Code endorsement level
----------------------------
License class None 5wpm 13wpm 20wpm
------------- ----- ----- ----- -----
Communicator L N+L __N+L_____N+L__ Lines added show
General F N+F |__G+F_____G+F__ which combinations
Advanced F N+F | A+F __A+F__ have the same HF
Extra F N+F | A+F | E+F privileges
```

Grandfathering will be as follows:

Novice becomes Communicator with 5wpm
Technician becomes General with 5wpm
General becomes General with 13wpm
Advanced becomes Advanced with 13wpm
Extra becomes Extra with 20wpm

In summary, to get any set of HF privileges, you must have the class and the endorsement that is required in the present system. It is only the names that have been changed, slightly. Other side effects of this system might be that

when you pass a the Advanced or Extra written exam only, holding no code or only a 5 wpm code endorsement, then you do not gain any new privileges though you do get a new class. Likewise, you probably will be able to keep your code endorsement forever even though you don't get any new privileges with it, such as a Communicator going up from 5 wpm to 13 wpm. The effect of all this is that the one year expiration of certificates indicating exam elements you have passed may be moot.

MOBILE COMMUNICATIONS SPECTRUM
SEEN AS CRUCIAL MATTER FOR WARC

STATUS: GTE filed comments advising the FCC that spectrum allocations for the new emerging enhanced wireless communications technologies are an urgent matter. Comments were filed in response to the Commission's Notice of Inquiry in Docket 89-554 to prepare for the 1992 World Administrative Radio Conference (WARC).

Other nations have been pushing their own agendas on these issues, with the United Kingdom taking the lead on CT-2 Telepoint Service and Personal Communications Networks. GTE set forth its technical assessment of these issues and urged the FCC to have the United States take a leadership role.

Some current spectrum users could ultimately be displaced as a result of actions taken at the WARC.

I agree! Remember I have never said that code is a good or proper lid
filter, and I've never said that bad operators can be seperated by their
licence classes, and I've never said I was against a nocode license.

What I have said is that HAM radio is a privilege. To gain access to this
privilege you have to prove your ability to perform as an amateur operator.
What I question is the mechanism for this evaluation. Currently, one must
learn morse code (useful?, I think so, necessary?, I think not) and pass
a written exam. The combined effort required (ie: dedication) is a certain
number of hours of effort, which the majority (for most folks) is the code
part. If you eliminate that, then you've eliminated the majority of the work.
This is where I take issue. If we're only going to rely on the written
tests to measure an individuals abilitys, then that test needs to be
comprehensive and require approximately the same effort as above.
This is NOT what the current propsal offers. It is not my intention to
keep good candidates out of the hobby, in fact just the opposite. I think
we have a high level of expertise and professionalism now and do not want
to see it severely diluted. If you think lack of use will make us loose
bands, wait and see what a bunch of poor operators with no technical
ability can do!

1265. P. Howard's Proposed Licensing Structure

Newsgroup: rec.ham-radio
Date: 1990-02-23 15:19:29 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9002231519.AA01504@cmr.ncsl.nist.gov>
Source record: 13320

Phil Howard has just proposed a new ham licensing structure.
He claims that it contains ONLY FOUR license classes, but then provides for
FOUR levels of code proficiency within each class.

If I had to enter these classes into a data base, I would find that there are
SIXTEEN different combinations. To my mind, Phil has proposed a structure
with SIXTEEN CLASSES, NOT FOUR. I see no diference between endorsements and
additional classes. They both result in a record-keeping zoo.

You may note my recent proposal which resulted in REALLY only four classes,
which some of you might want to increase to five to allow a "low-tech
with CW" entry path.

My classes were:
Extra (as at present)
Basic (13 wpm CW, present General AND Advanced, with Advanced privileges)
Technician (Same theory as Communicator, but with 5 wpm code)
Communicator (No code, moderate theory)
to which you COULD add
Novice (5 wpm, simple theory, non-renewable)

I proposed that all Novice tickets expire in the year 2000,
and that the class be dropped - figuring that Communicator-class theory would
be simple enough to not present a problem to anyone over 10-12 years of age.
I'm not sure that one can make a strong case for NEEDING even younger hams.
My boss of many years got his ham ticket at the age of 8, back around 1930,
when the CW requirement was 10 wpm (I think), and the theory test was essay-
style .... but he is outstandingly smart, and was likely the youngest ham at
the time. BTW, there were no other technical people (or hams) in his family.

I DON'T THINK WE NEED AN EVEN MORE COMPLEX LICENSING STRUCTURE. MOST COUNTRIES
GET BY WITH FEWER CLASSES THAN THE US.

Bob, W3OTC
(My employer doesn't endorse these views.)

>guy, V31BB, conducting the MFJ JUNK NET.

I ran across this guy during the 23:00z hour last Sunday. He claims that the workmanship of his MFJ stuff is bad, and he appears to be doing a net. I only heard him, and not others, but the nature of propagation on 10M is like that.

Is MFJ stuff really that bad? Only thing of MFJ I have is a 24hr clock from Japan, and it's standard consumer grade electronics.

I have an MFJ antenna tuner which appears to be made of Radio Shack-quality parts (i.e., sub-consumer grade). The switches are very noisy and one of the tuning caps was destroyed by dripping solder. I have their dual 24hr clocks and their switches are flaky, making it hard to set the time. The clocks also drift much more than any of my various Casio timepieces.

I wouldn't buy anything from MFJ, and I don't buy anything from Rat Shack more complicated than batteries or speaker wire.

1267. WEBER Protocol spec

Subj: correct protocol

I have been told there is an erroneous description of the picture protocol published on Compuserve. To avoid the possibility of people wasting their time with it, below is the correct, complete description.

The format of picture data for the camera color composite signal is as follows:

Callsign (for this transmission scheme) is PHOTO (for the camera). SSID is picture number (modulo 16). We are currently often overwriting a given picture number with different pictures perhaps twice a day. This is done when a picture is clearly black and there is no point in getting all of it.

The first two bytes of data portion of the UI frame (packet) contain the 10-bit X position of the first sample in that packet, the two most significant bits of the X position occupy the two least significant bits of the first byte, the eight least significant bits of X are in the next byte. Legal X values are from 0 to 644. Y values are in third byte and range from 0 to 241. If the two least significant bits of the first byte are both set (forming an X 768..1023), the data beginning with the second data byte is clear text information about the picture (which we call the "picture header") occupying 252 bytes. The six most significant bits of the first byte are reserved for future protocol definitions, only one of which is presently defined.

The data then consists of a sample for every third X value. This has little to do with RGB, but is relevant to color as the NTSC waveform is sampled at precisely 3 times the color burst frequency. A zero byte value indicates a simple compression sequence as follows: 00, the count of repeats, then the value repeated. Actual samples with a value of 0 (hor. sync) are changed to 1 to allow indicating a following compression sequence. When the X value is greater than 644, increment the Y value by two and subtract 645 from the X value. At the end of one of these compression passes, encoding returns to the top of the pic, moves one byte to the right and proceeds. This takes place three times to complete one half pic (every other line). Alternating half pics (even vs. odd) lines are transmitted every 101 minutes (every other visibility pass at these latitudes). There is not vertical sync transmitted. The picture begins at the end of the header.

The 645th byte of a reconstructed line is the count of zeroes which was in the original digitized sample between the 644th byte of that line and the beginning (the first non-zero) of the next line. If you are reconstructing the original waveform replace that count byte with that many zeroes.

I must again emphasize that this protocol is very temporary and can be expected to change with little advance notice. The compression scheme is poor and was selected only for its simplicity. It also will change. These changes will be handled with Weberware version updates. Also, please note that we have the ability to download individual R, G or B signals from the camera and their protocol may be different. Ditto for the 1.2 GHz experiment. For those, however, you can expect a bit more advance notice of variation.

As of today, only one picture has been arguably of the earth. We have been taking pictures (15) for only 8 (12 of our 15 on the first day) days now and it will require time to polish our procedures. We are concentrating on the equator now because pre-launch projections suggested potential problems at high latitudes. The first 12 pics were over the U.S. and none were of the planet. We have taken one pic at night (in the dark) to characterize performance. Two interesting tidbits. Shots that turn out to be of the sun don't move the impact sensor because, presumably, the iris is stopped down and has little distance to spring closed. Deep space photos increment the impact sensor considerably. The second tidbit has to do with the night photo. It has an average light level much lower than even the deep space photos taken during the day. Perhaps a little atmospheric glow around the spacecraft even at that altitude?

Thank you all for your interest.

73's,
Chris, WA3PSD, WEBERSAT project leader

P.S. Photo 1 is a pretty good shot of straight down over the ocean. A large cloud bank is visible against the blue water. It does NOT look like much in B&W. I can tell you from experience, VGA is required, the EGA displays suck. AMSAT will be distributing WEBERWARE, color black and white display stuff with a decompression routine.

Bob

1268. Helical Resonator Challenge

Newsgroup: rec.ham-radio
Date: 1990-02-23 17:03:26 UTC
From: gregm@hpcvra.CV.HP.COM
Message-ID: <5710006@hpcvra.CV.HP.COM>
Source record: 13323

Helical Resonator Question......

I have a challenge for the masses on the net.....

Here's my situation. The local club is trying to put up an autopatch
on the local OSU 2M repeater, and we have run into a snag --- mainly "too much
RF" from other sources on the hill. There is all kinds of stuff up there
including a channel 7 TV signal, channel 25 and various sheriff repeaters,
etc......

Using a "hot" Hamtronics receiver on the hill and a 5 element beam as our
link "to the hill" (because of the cost of "out of the way phone lines"),
we are able to get a very solid signal to the hill. Using a handheld, the
signal is perfect. Unfortunately, the Hamtronics likes all the other signals
up their too. There is all kinds of intermod junk comming out of the 450
receiver and audio "junk" is passed on the the 2M repeater input.
(The 440 handheld can also hear this stuff with squelch open --Heathkit)
Now, we have found that with all the filtering (power lines, etc.) that 30db
of attenuation on the front end of the 450 receiver (outside the box) cleaned
up just about all the intermod (yes, you can still hear the 450 uplink).
I personally did not hear this demonstration, but the general feeling in the
group was that the helical resonator was the way to go. (My guess is we
are running out of link signal at 30DB, and it is starting to get noisy.)
We cannot/don't want to increase the 450 uplink signal at the transmitter.

Now, the challenge for those who dare... Does anyone have information where
I can get my hands on some articles to educate ourselves on these resonators.
They sound interesting. I have one article but feel that I am still in the dark
about the building technique. I think this would be the perfect opportunity
for another club project.

Any other ideas of what to try...???

Thanks in advance for your comments.

Greg May KB4OX (in 7 land)

1269. Cable & TV Channel Frequencies

From: herbster@b11.ingr.com
Message-ID: <7554@b11.ingr.com>
Source record: 13177

Seems to me that the "No-code" gang has no further need to whine.
O.K. you win. I "worked" for the Novice ticket at the age of 8
and passed on the third try. I could copy 12wpm, but the theory
was tough at that age. The only privs a novice had then was CW.
The "Incentive" was there 2 years later to upgrade to Advanced
and get voice privs. 20 years later, a friend of mine from Iran
managed to learn 5wpm and pass the Technician class in three weeks
even though English is not his primary language. I'm sorry folks,
I just can't help but feel that Morse Code is only a barrier to
getting into Amateur radio if you have "NO DICIPLINE". I have never
had anyone approach me wanting to get into radio that just could
not get the code. A six year old can do it (i did), non-technical
folks can do it (my friends have) so what is the problem here??

If you want to "experiment and pioneeer" the advance of radio
technology, I see nothing wrong with requiring a little history
lesson (how we got to packet) with regards to one of the most
commonly used transmission modes in the world. This "lower-the-
water" instead of raise the bridge attitude just smacks of lack
of dicipline. This lack of dicipline thing has bothered me for
some 10 years now. I don't think CW is a "lid-filter" because the
lids have gotten in. This constant berating of the "O.F.s" and
"Their code" sounds alot like the disaster on 14.325 as of late.

I guess I am just nostalgic, things used to be so genteel
and polite on the air. Over the last decade, I have kissed 15 and
20 meters away. Goodbye old friends, THEY have moved in. I find
myself spending more and more time these days using CW because you
can almost go back to a time of courtesy and dicipline there. It
is still hard to scream and rant in CW and the OFs that use the code
just seem to be less prone to lidness (notice i said less prone, not
imune). The WARC bands are another place of solice, where we OFs go
to chew the rag endlessly while one of those #$#%$ contests are
trashing the other bands.

While I conceed that the Communicator class was inevitable,
and there seems to be no REAL good argument against it, I just
can't explain the terrible forboding i feel. Its not as if things
will go BANG and get bad, they have been getting bad for many years
now. I just can't help but think that this attitude and lack of
dicipline will accelerate the degradation that has already begun.

Which band do we kiss off next??

de km4jn
(o.f. for 22 years).

1273. Re: (posting src) Update on WEBER picture format

Newsgroup: rec.ham-radio

From: cb@cci632.UUCP
Message-ID: <34603@cci632.UUCP>
Source record: 13178

I have heard this discussions along the way before about posting
executables and source code. Maybe some of you are priveledged in
being allowed access to the sources and binary groups, However,
many companies squash them. According to one SA, users tend to
keep their own copy of the source/exe and then lots of copies
exist wasting system space etc.

I would hope that those rare occations that source/exe are shipped
along with this news group, or somehow a mailing list for it.
I have quite a job ahead of me to retrieve these files if their
posted elsewhere (execpt ibm.binaries). I had to make specail
arrangements for that. (Iwish I could ftp but...)

Anyone got any better ideas??

From: kwmc@cbnewsj.ATT.COM
Message-ID: <3980@cbnewsj.ATT.COM>
Source record: 13179

I desire to use a pair of portable CB radios as an emergency communication system. The area in which they are to be used is rural and rather hilly and I need to have a reliable range of 2.5 to 3 miles between units.

Can anyone help me to know what kind of wattage I would need ?

Further details of the application and questions follow.

Three years ago my mother had a heart attack and was advised to "take nice long walks as part of her recovery and treatment. This winter, while out walking, she slipped and broke her arm some distance from the nearest house. While this was not life threatening it caused her some distress.

I am hoping to give her a light portable CB which she can use to summon help from home (my dad) and it should have a range of 2.5 to 3 miles (reliably).

Question is what wattage should the units be ?
Is there a formula for wattage to range conversion ?
Are US CB radios different from British ? (FM vs AM ?)
(There's certainly a difference in price.)

Thanks for any help you can give ... Ken mtdca!kwmc

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world on UseNet and Amateur Packet Radio. It is available for UNLIMITED distribution.

* SAREX-2 TESTING CONTINUES *
============================
Last week, the Shuttle Amateur Radio Experiment #2 (SAREX-2) packet radio station underwent extensive testing at the Marshall Space Flight Center in Huntsville, AL according AMSAT Area Coordinator Ed Stluka (W4QAU). This testing was being perfomed in conjuction with the training of STS-35 Payload Specialist Ron Parise (WA4SIR) in the use of the ASTRO-1 experiment which will be primary payload on that shuttle mission. The primary payload, ASTRO-1, will be used to conduct a number of astronomical experiments. During the several days of testing this week, radio amateurs in the Huntsville area were invited to connect to WA4SIR and to receive a QSO number.

This special packet radio station flying on STS-35 on May 9, 1990 will give each radio amateur who connects to WA4SIR a QSO number confirming their contact. When the connecting station sends their QSL card in with this contact number, they will receive back a beautiful QSL card commemorating this HAM IN SPACE shuttle flight. The SAREX-2 packet radio station consist of a Motorola 2M FM H/T with 5 watts ouput, a Heathkit HK-21 TNC-2, and a GRiD laptop computer that has a 40 MB hard disk drive to store the calls of all the stations connecting to WA4SIR during the nine day mission. The specially written software which will be running the SAREX-2 packet station is designed to allow for completely unattended operation and logging of the calls of all connecting stations. It will also prevent duplicate QSO numbers being sent! Although no digipeating will be allowed through SAREX-2, connecting to this packet station will be like any terrestrial packet contact. Just use your TNC along with your 2m tranceiver, and everything else is the same. After you have connected and received your QSL number from WA4SIR, on subsequent orbits you can watch for the SAREX-2 message beacons being sent periodically. The message beacons will contain information about the flight of STS-35 and other interesting items.

Look for more information about the SAREX-2 mission in AMSAT News Service (ANS) bulletins and on AMSAT HF/VHF nets in the next couple of months. For

more specific information about the ASTRO-1 payload, contact the SPACELINK BBS at (205) 895-0028.

ESA, the European Space Agency, lost a 44-L booster yesterday, which was carrying two Japanese comsats to orbit. ESA has suspended use of the Four series until further notice.

Just glad we got the Microsats off before this happenned, let alone another Phase IIIa disaster...

Well, here I go again. If we had *decent* public relations (i.e. advertising)),
then John wouldn't have had to ask at least questions 1-3. When are we
collectively going to realize that it's not whether or not we have a no-code
license that's going to "save ham radio" but rather public awareness of who we
are, what we do, and how important we are to the country! Hell, look at the
latest W5YI report. The FCC's newest commissioner, Sherrie Marshall, couldn't
even get the ARRL's name right. Maybe *that* will finally get the League to
spend some $$ on PR instead of the "Star Wars" W1AW (before you flame, yes, I
know it was financed with donations).

1281. Helical Resonator Challenge

Newsgroup: rec.ham-radio
Date: 1990-02-24 12:18:17 UTC
From: MROWEN@STLAWU.BITNET
Message-ID: <9002261337.AA02092@ucbvax.Berkeley.EDU>
Source record: 13186

Regarding the front-end problems at OSU:
It sounds to me like you have problems both
with intermod and simple front-end overload
(padding 30 in front of the RX cleared up the problem
and you could still hear the TX).
Rather than helical resonator(s), which are a little
small at 450 MHz and thus hard to build by hand, I
would recommend a 1/4 wave cavity filter. You can
build one out of hardware store plumbing parts and
hobby brass tubing, plus a couple of connectors.
Nothing to it, and the cost should be about $2. It
ought to give you 30db out-of-band rejection.

1282. Heath HD4040 and ICOM IC-2AT

Newsgroup: rec.ham-radio
Date: 1990-02-24 18:48:42 UTC
From: jwhitson@wpi.wpi.edu
Message-ID: <9073@wpi.wpi.edu>
Source record: 13187
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Does anyone have any experience with this? The problem is
that in the way the PTT is on the ICOM 2AT, its not
compatible with the TNC's output.

My question is: who has done the correct interface as
reccommended by Heath (using 3:1 audio transformer),
and does the transformer have to be 3:1, or would an
ordinary 1:1 work? (I'd wind one, but I don't have
access to torodial cores.)

Thanks ....

1283. New Numbers at WB3FFV Ham BBS!

Newsgroup: rec.ham-radio
Date: 1990-02-24 23:55:46 UTC
From: howardl@wb3ffv.ampr.org
Message-ID: <2736@wb3ffv.ampr.org>
Source record: 13188

Hello All,

I have just moved the wb3ffv ham bbs to a new location, so see the attached
information for the new dialup information...

+--+
HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there is other stuff on-line). As of now I have not
attempted to promote this system any place except in the amateur channels
(PACKET, USENET, & word of mouth), and will continue under this policy, as
I hope to keep it oriented toward amateur radio. The various software for
UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through
user support I hope to keep the latest and greatest ham software on-line.
Below is the information that is needed in order to access the BBS via
Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs
Number: (301)-625-0817 -- 1200 & 2400 (Non-MNP)
Number: (301)-625-9482 -- 1200 & 2400 (MNP5), 4800 & 9600 V.32 (V.42/MNP5)
Number: (301)-625-9663 -- 1200 & 2400 (MNP5), 9600 & 19200 (PEP)
Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS)
IP Address: 44.60.0.1 {wb3ffv.ampr.org} [for FTP access on 145.550 mhz ONLY]
Misc. Info: Machine is an 80386 computer running UNIX V.3.2 and features 700
Meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage
all to upload anything new that they come up with, as it is of benefit to all.
Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release)
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.12)
W0RLI BBS for the PC (Versions 6.xx, 7.xx, 8.xx, 9.xx, 10.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.07)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01)
Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)

DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

RTTY DX Notes, 1of3, 2/23/90

RTTY DX Notes For Weekending 23rd February 1990
Part 1 of 3.
BID: $RTDX2302

During the week a packet station was seen on 14064 KHz, while another
has taken up residence on 14083 KHz. 21077 KHz has also received a
visit, but i believe that was to tell the W1AW code practice to "Get Off
My Frequency". One wonders what communications has been reduced to?

Our thanks this week go to I5FLN, JA1BLV, JG1NBD, OD5NG, TG9VT, UT5RP,
VK2EG, W1DA, and W6/G0AZT. Thanks chaps for your interest and help.

SB ALL @ ALLUSA $RTDX2502
RTTY DX Notes, 3of3, 2/23/90

RTTY DX Notes For Weekending 23rd February 1990
Part 3 of 3.
BID: $RTDX2502

Having problems with QSL for UO5OK? Try sending them via UT5RP. Dima can get the cards for you.

Notes of Interest:

KL7JAF/C6A will be in the Bahamas until the end of the month.

JH1LBR will sign T32LB from March 22nd until 27th.

IS0XV (Spratley) is still planned for 15th March through 30th March. If you wish to send donations we will advise you shortly. In case of cancellations all donations will be refunded.

OH2BH with some YV operators will be active from Aves Island (YV0) for one week about mid March. Martti will be going to Jarvis Island and Conway Reef later in the year.
JA3AUQ will be in 8Q7 (Maldives) from 27th February until 4th March.

RW3DX informs us that he will be going to Vietnam (3W) around the 13th of March, with UA3DK and UA3DZ. The calls will be 3W3DX, 3W3DK and 3W3DZ. QSL RW3DX to Box 145, Dubna, 141980 USSR, and UA3DK and UA3DZ via Box 45 Dubna 141980 USSR.

It is reported that all Russian amateurs who hold first category of radio station license will be permitted to use packet, SSTV and RTTY from March 1st without having to obtain prior permission as has been the case up until now.

EA9JV reports that the Western Saraha (SO) DXpedition is still on, and should appear around the first week of March with the callsigns of SO1EA, SO2EA, SO4EA and maybe SO1LYNX. QSL to The Lynx DX Club. EA9JV also says that he is trying for 7X for a one week stint after the Western Saraha operation. More later.

GL DE DX1 (VK2SG).

1285. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-02-25 05:40:35 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9002261339.AA02311@ucbvax.Berkeley.EDU>
Source record: 13190

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

1286. ACC's RC-850 repeater controller, bugs, mods, and support

Newsgroup: rec.ham-radio
Date: 1990-02-25 06:36:35 UTC
From: mikey@pnet01.cts.com
Message-ID: <1650@crash.cts.com>
Source record: 13191

I am sysop on a 220 Mhz repeater in San Diego County. We have had the Advanced Computer Control's RC-850 repeater controller online since 1987. I'm
looking for anyone with experience with the same controller. I have found numerous bugs with the firmware and would like to discuss mutual problems.

We started with firmware version 3.41 and upgraded to 3.42 as soon as it was released. The revision was nice in many respects but somewhat clunky in
others. We are runnings the 850 with the voice option, no DVR, UF functions in latched, 3 remote bases, control receiver, home-brew autopatch at the site
and 1 remote auto-patch using firmware support of REMOTE PHONE 1.
Overall, we have been very pleased with system even with some of it's short-commings. I have talked to ACC by phone a few times about the clunker bugs,
but they were'nt to concerned by them and, I doubt, that they even logged them for fixes in later releases.

I would now be interested in a MS-DOS based controller with voice support. Anybody want to comment on this aspect of computer-controlled Ham repeaters.

Thanks, 73's

...Mike

I have a Fujitsu Ten 450-470 commercial tranceiver (model # FTM40-3092H). This is a 16 channel scanning synthesized mobile radio.
I'm looking for a way to be able to program the radio down into the ham band. It currently on 453 Mhz. I have the programming prom for the radio and, of
course, it will not allow entry of freqs below 450. I called Fujitsu and you can guess what their response was after they figured out that I had a
programming prom. So here I am. This is a nice radio and I only have limited use of it in the commercial segment. If anyone knows any way to get around
the programming restriction, I'd appreciate any responses.

Not until the no-coders have their way, have successfully joined up with the FCC in jamming no-code down our throats, and the bands are overrun with the "freebanders" instead of the technical whizzes they comtinuously hold out as the no-code ideal - in short, after it kills ham radio - will that dawn on them. Unfortunately, it'll be too late.

1289. INFO-HAMS STATISTICS ???

Newsgroup: rec.ham-radio
Date: 1990-02-25 13:12:00 UTC
From: RHAREL%FAB8@SC.INTEL.COM
Message-ID: <9002261404.AA03742@ucbvax.Berkeley.EDU>
Source record: 13194

Does anyone know of statistics concerning users of INFO.HAMS ???

It would be interesting to know the following info. :

1. How many are on the mailing list.
2. Breakdown by state/country
3. Breakdown by institution (University, Government, Military, Industry)
4. How many links to local BBS's

etc...

73's to all,
4X1DA @4Z4SV

> Phil Howard has just proposed a new ham licensing structure.
> He claims that it contains ONLY FOUR license classes, but then provides for
> FOUR levels of code proficiency within each class.

I am using the FCC's concepts. They have 4 classes and at least 5 "class
combinations". I am only extending the concept they started.

> If I had to enter these classes into a data base, I would find that there are
> SIXTEEN different combinations. To my mind, Phil has proposed a structure
> with SIXTEEN CLASSES, NOT FOUR. I see no diference between endorsements and
> additional classes. They both result in a record-keeping zoo.

Yes, this is correct. The FCC is going to have some sort of zoo on their
hands no matter what is done UNLESS they abandon incentive licensing now.

> You may note my recent proposal which resulted in REALLY only four classes,
> which some of you might want to increase to five to allow a "low-tech
> with CW" entry path.
>
> My classes were:
> Extra (as at present)
> Basic (13 wpm CW, present General AND Advanced, with Advanced privileges)
> Technician (Same theory as Communicator, but with 5 wpm code)
> Communicator (No code, moderate theory)
> to which you COULD add
> Novice (5 wpm, simple theory, non-renewable)
>
> I proposed that all Novice tickets expire in the year 2000,
> and that the class be dropped - figuring that Communicator-class theory would
> be simple enough to not present a problem to anyone over 10-12 years of age.
> I'm not sure that one can make a strong case for NEEDING even younger hams.

> style .... but he is outstandingly smart, and was likely the youngest ham at
> the time. BTW, there were no other technical people (or hams) in his family.
>
> I DON'T THINK WE NEED AN EVEN MORE COMPLEX LICENSING STRUCTURE. MOST COUNTRIES
> GET BY WITH FEWER CLASSES THAN THE US.

True. And we don't need much more than 2 levels. However as long as we have
incentive licensing, and those who now have "turf" they will surely want to
protect, we have a big hairy ball of wax on HF.

However, we do need to have a VHF-up class that has ALL privileges above
30 Mhz. I mean ALL as in NO EXCEPTIONS. There is NO REASON that CW should
be required for access to 6 meters or 2 meters, nor for a maximum of 1500

watts, nor for repeater/beacon/auxiliary control op privileges, when some other VHF-up privileges don't require it. All the stated reasons for a no-code license apply to ALL privileges above 30 Mhz.

What I tried to come up with was a way to get that in there.

Bob's suggestion is a good one; don't get me wrong. It is worth writing your comments to the FCC (re: 90-55) and suggesting. I put forth yet another such proposal. You should suggest any or all that you feel are worth suggesting.

I would be satisfied with the only VHF-only class having ALL privileges above 30 Mhz, but I MUST INSIST that the exam for it be NON-trivial. It should have no less than 250 questions from a pool of 2500. However such a license class is more appropriate for the techno-nerds who use 1500 watts, work EME, and are repeater ops, than for "public service" and other kinds of people. The latter group can live with 200 watts and no repeater op privs. They should get access to 2 meters, though. THIS IS WHY ULTIMATELY WE DO NEED TWO CLASSES OF NOCODE LICENSE (though 2 is the maximum needed).

LET TECHNICIAN BE A NOCODE LICENSE CLASS, TOO !!

That leaves 4 more classes in the FCC database. I invite other ideas on how to arrange and structure the classes. If we limit ourselves to just THREE levels of HF privileges, then we can cross combine the possibilities (2x3) and have 6. However, General and up should have all VHF privs anyway, so the numbers are less, still. Try working it out for yourself. BE SURE TO LEAVE NOTHING OUT, or else suggest that it be abandoned (and why) if you do.

Artech House Books. (1-800-225-9977) publish:
"Filters with Helical and Folded Helical Resonators" by Peter Vizmuller.
(0-89006-244-7) C9244 $54.00

You may be able to get this from your local library (If its good).

Digi-key sell some helical resonators by toko at 70cms. They are designed
for small receivers and so have a reasonably hign insersion loss (5db for
the three stage ones!). If you want low loss you just have to make them
big (and silver plated). This doesn't sound like a problem in your application.
I would sugest you borrow a network analyser to line it up.

Also check out the RSGB VHF UHF Manual by G.R. Jessop G6JP. A really
excellent book and has a couple of pages on helical resonator design.

Source record: 13197

Hi y'all! Has anyone had any experience hooking up a David Clark headset to an Icom ham handheld? Apparently, Icom makes a special interface in two different versions, but being an adventurous type, well, ok, cheap actually, I'd like to save myself the $50 for the lower priced of the two and try and make one. The headset is the DC 10-20, which uses a dynamic mic, so the mic needs some kind of bias voltage at the minimum, if not an entire pre-amp section. That's about all I've been able to figure out. Thanx!

1294. small QRP HF transceivers

Newsgroup: rec.ham-radio
Date: 1990-02-25 22:59:00 UTC
From: IZZYH79@OAC.UCLA.EDU
Message-ID: <9002261406.AA03880@ucbvax.Berkeley.EDU>
Source record: 13199

A few years ago when I was in Germany, I visited a ham (with whom
I have since lost contact) over there. Of his equipment, some
equipment which stood out to me were a couple of QRP handheld
HF transceivers for CW which were made by some Japanese company
which I have never heard of before (and can't remember the name,
either!).
Anyway, there are apparently several models for different
bands, from 40 meters through 10 meters, each monoband.
I plan on doing a several week hike in the Sierras this
coming summer and I am looking into the possibilities for
ham equipment to take along. My VHF/UHF handie wouldn't
work in valleys (most of the trip!) and my Heathkit HW-8
is a little big and heavy to be carrying around for weeks.
So... does anyone have any info on this kind of HF QRP
rig? Mfgrs, availability, price, etc??
Thanx & 73!
Arun WC6V

1295. Digital Licence

[NOTE: Message modified, 25 Feb 90 17:34:38]
> Digital licence holders - grandfathered to ADVANCE

Not to my knowledge from both talks with a radio inspector and the last offical update on the new licencing.

Digital Licence holders will be deemed to hold the new basic amateur certificate and the advance technical certification. They will only be able to opperate above 30 mhz. using all modes etc.. The¿y must pass the 5 wpm or 12 wpm test to operate below 30 mhz. (HF).

WD2F asked about extending coverage on the Uniden HR2510 and 2600.
That only worked on the early model 2510 that did not have the
potted processor chip. All it took were a couple of pull up
resistors. The later 2510s and the 2600 are set up so that
they cannot be put on CB.

1297. Listing of Macintosh ham software

Newsgroup: rec.ham-radio
Date: 1990-02-26 00:48:30 UTC
From: winter@Apple.COM
Message-ID: <38958@apple.Apple.COM>
Source record: 13202
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

I've put together the following listing in response to requests here
on the net for information on amateur radio programs for the Macintosh.

This is a one-time posting on my part. If someone would like to
volunteer to keep this information updated, I'd be happy to send him
or her the background materials I have. It would be even better if that
person was also on packet radio; when I had a packet system up and
running, I noticed frequent Macintosh questions there, too. (If anyone
wants to post this listing on packet, go ahead. But I'll leave it to
you to take out the prices, divide it into smaller chunks, etc.)

Please note that I am not endorsing or recommending any of these programs.
In fact, I've only seen a few of them. The information in this list was
gleaned mostly from flyers supplied by the software vendors, or in some
cases from reviews or listings in QST or AMSAT Journal. Please check
with the vendors for the latest product details, pricing, etc.

And--this should be obvious--this listing has absolutely no endorsement
by Apple Computer, Inc.

Having said all that....enjoy!

73,
Patty

****
Macintosh Amateur Radio Software
List compiled by N6BIS, 2/25/90

PACKET RADIO

NET/Mac (KA9Q TCP/IP)
Supports AX.25 and NET/ROM as well as TCP/IP functions. Requires
a TNC with KISS mode.
Doug Thom, N6OYU, 1405 Graywood Drive, San Jose, CA 95129.
Send formatted 800K Macintosh disk with stamped, self-addressed
return disk mailer. Also available via anonymous FTP from apple.com
(/pub/ham-radio); on the Digikron Systems BBS at (408) 253-1309;
and on the WB3FFV BBS at (301) 625-0817, 625-9482, and 625-9663.
The program is copyright, but free for noncommercial use.

MacRatt with FAX
Terminal program for use with AEA's PK-232 multimode controller.
Supports packet, CW, RTTY, AMTOR, and facsimile. Includes
computer-to-TNC cable.
Advanced Electronic Applications (AEA), PO Box C-2160,

Lynnwood, WA 98036. $59.95

MORSE CODE PRACTICE

N6MZV Morse Trainer
RT Martin, N6MZV, 10382 Orange Avenue, Cupertino, CA 95014.
Also available via anonymous FTP from apple.com (/pub/ham-radio).
$25.00

Morse Tutor
Jack Brindle WA4FIB, Brincomm Technology, 3155 Resin Street,
Marietta, GA 30066. Send formatted 800K Macintosh disk with
stamped, self-addressed return disk mailer. The program is copyright,
but free for noncommercial use.

MacMorse
David A. Kall, 700 Marine Parkway #314, New Port Richey, Florida
34652. $29.95

Zihua Morse
Zihua, P.O. Box 51601, Pacific Grove, CA 93950. $39.95 without
speech synthesis; $65 with speech synthesis.

RTTY

MacTTY
Summit Concepts, Suite 102-190, 1840 41st Ave., Capitola, CA 95010.
$39.95

LOGGING

LOGic
Personal Database Applications, 2634 Meadow Bend Court, Duluth,
GA 30136. $75.00

FDLog!
System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN
55443. $29.95

SATELLITE TRACKING

QuikMac
AMSAT, PO Box 27, Washington, DC 20044. $40 for AMSAT
members; $50 for non-members. Requires Microsoft BASIC.

Satellite Orbit Prediction Program
Macintosh conversion of W3IWI program.
Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015.
Send formatted 800K Macintosh disk with stamped, self-addressed
return disk mailer; or send SASE for source listing. Requires
Microsoft BASIC.

MacSat
BEK Developers, 1732 74th Circle NE, St. Petersburg, FL 33702.
$10.00

Satellite Helper
MacTrak Software, PO Box 1590, Port Orchard, WA 98366. $59.95

Satellite Pro
MacTrak Software, PO Box 1590, Port Orchard, WA 98366. $99.95

PROPAGATION, GRAY LINE, DX HEADINGS

DX Window
Creates on screen an azimuthal equidistant projection (great circle) world map centered on your QTH, with day/night terminator.
Engineering Systems, Inc., PO Box 939, Vienna, VA 22183. $39.95

Skycom 1.1
Enter solar flux and get propagation predictions to desired areas of the world.
Engineering Systems, Inc., PO Box 939, Vienna, VA 22183. $39.95
($59.95 with Skycom 1.5)

Skycom 1.5
Provides sunlight status at both ends of the path; MUF, F0F2, and FOT frequencies; S/N ratio of the link, and other information.
Engineering Systems, Inc., PO Box 939, Vienna, VA 22183. $39.95
($59.95 with Skycom 1.1)

DX Helper
MacTrak Software, PO Box 1590, Port Orchard, WA 98336. $34.95

Sun Clock
Desk accessory. Displays a map of the world with day and night areas.
MLT Software, PO Box 98041, 6325 SW Capitol Highway,
Portland, OR 97201. $17.00

RADIO CONTROL

ICOM IC-735 Control
KE6FG Software, 9763 Pali Ave., Tujunga, CA 91042. $49.95

TEST PREPARATION

Ham Stacks
HyperCard stacks containing all of the questions in the current question pool for each license class.
Diana Syriac N1GZS, 49A Meadow Pond Drive, Leominster, MA 01453. Send two formatted 800K Macintosh disks with stamped, self-addressed return disk mailer. Also available via anonymous FTP from apple.com (/pub/ham-radio).

COLLECTIONS AND MISCELLANY

"Project Mac"
Contest logging, antenna design, satellite tracking, clip art, etc.
Microsoft BASIC required for many (but not all) of the programs.
Stan Horzepa WA1LOU, 75 Kreger Drive, Wolcott, CT 06716.
Send three formatted 800K Macintosh disks with stamped, self-

addressed return disk mailer.

Amateur Radio #1
Contains satellite tracking, Morse code practice, Ohm's law calculator,
and pad design programs.
Kinetic Designs, PO Box 1646, Orange Park, FL 32067. $4.00

Red Ryder 9.4
Terminal emulation program, suitable for packet radio.
Kinetic Designs, PO Box 1646, Orange Park, FL 32067. $4.00

MacScience BBS
Various ham-related applications, including antenna design,
propagation, WEFAX, packet, and Morse code. (408) 866-4933.

Digikron Systems BBS
Various ham-related applications, including logging, propagation,
Morse code, and packet. (408) 253-1309.

WB3FFV BBS
Various ham-related software, including packet, contesting, and Morse
code applications. (301) 625-0817, 625-9482, and 625-9663.

MacNet
Public-domain programs (currently on nine disks) contributed by
Macintosh packet users. Includes test preparation, contest logging,
propagation prediction, satellite tracking, and amateur television.
John D. Seney, KB1HE, 144 Pepperidge Dr., Manchester, NH
03103. Send formatted 800K Macintosh disks with stamped, self-
addressed return disk mailer. Contributions of public-domain
programs encouraged.

1301. Re: ACC's RC-850 repeater controller, bugs, mods, and support

Newsgroup: rec.ham-radio
Date: 1990-02-26 03:56:47 UTC
From: alan@km4ba.UUCP
Message-ID: <121@km4ba.UUCP>
Source record: 13206

Sorry to have to tell you, but welcome to the world of ACC! Most firmware revs. seem to introduce more bugs than they fix, and ACC is not very helpful. The first answer is denial, second is that your site is the only one experiencing the bug. When pressed, they give the "don't have the resources" to fix it right away answer, and when they finally fix it, the cycle restarts.

Personally, I think their code has been patched & mutated until it is unstable, and unmaintainable.

The least expensive S-COM has technical features & sw capability that only the RC-850 (top of the line has), and packaging on the 85 is poor, to say the least. Things like minimal audio adjustments on the 85, which results in what we call "ACC syndrome". (15kc deviation on the voice ID when Adjusted for normal 5kc repeater audio. The fix is to tack an extra pot onto the pc board.)

We won't even talk about the DVR, and allthough the ICOM 900 remote base feature is nice, it still has severe quirks that can cause it to lock up.

I am sure this will bring out the ACC defenders, who love the features, but I have had my fill. (85,850,dvr,IC-900 remote)

To answer your question, a local ham Dan wb4pyl developed a nice PC based controller/autopatch/DVR that has been used in atlanta for 12-18 months. I don't know the status of his sw/hw regarding purchase, but you may want to drop him a line. (..!gatech!kd4nc!wb4pyl)

I am sold on S-COM for most purposes, but am also interested in PC based controllers.

73 & good luck with ACC.

Well, here we go again. All of the folks from the university radio clubs come out of the woodwork. We all seem to agree that it is difficult to keep such an organization going. Apathy and a general lack of time and funds are all great contributors. I know; we have the same problems here. Earlier this year/semester there was quite a bit of talk on the net about a nation-wide organization of university clubs that had existed at one time. In the past there had also been a net of sorts on 20 and 40 meters. As far as I know that all fell apart over the summer. (Summers sure have a way of disturbing the continuity of club activities....) Perhaps getting on the air with a net once again can be at least a bit of an incentive to keep things going in the university community. I think there have been at least 4 separate responses to the original post. I know there are at least 10 or more schools with clubs that I have seen on the net. I had discussed this a bit with KA9WGN (Phil - I hope I got the call right....) and we discussed the possibility of a 10m net to allow participation by the Novice/Tech persons as well. I propose that we attempt to convene a net this comming Saturday, 3/3 on 28.425+- at 1800Z. I realize it may be rough on 10, but lets give it a try. If anyone has any better time/freq suggestions, I would like to hear from you. We can always try some other bands in the near future. I will volunteer to try and call the net from Wash U club station W0QEV. Any university clubs, individuals, or interested parties are welcome. Please be persistent in calling and we will try to pick everyone up via relays if need be. If this works out, we can try it each Saturday.

73 and see you on the air...
Scott

(Phil - can this be relayed to HAM-UNIV?)

I have often been frustrated while trying to explain to the less intelligent/inexperienced why ham != CB or why my handie-twinkie and an HF rig are both part of the hobby. However, the funniest such occasion in recent memory occurred when a woman I once dated got into my car and asked me about my handheld lying on the seat. I proceeded to give her a cursory explanation of the hobby and why I had the radio.

She then said, "Oh, so who has the other one?"

Scott

Thank you.

Well, as a matter of fact the Digital Amateur class has not proven to be particularly popular. That's too bad. Perhaps it wasn't given enough "airtime" :-) (that is, enough publicity), or perhaps it's because it never reached critical mass. After all, our amateur population is spread out over a much larger area than the American ham community - and the Digital class is restricted to 2 meters and up. This means there's not many other stations within shouting distance.

As an example, this weekend I drove down to Lake Louise from well north of Edmonton (and back the next day - 675 km each way). There's a repeater in Athabasca, 3 in Edmonton, two in Red Deer, and one in Rocky Mountain House. I heard 4 other hams during the whole trip, and worked one (for about 2 minutes). That's on 2 meter voice. Didn't hear a single packet during the whole 14 hours, and I was all over the band. Not much encouragement, is it?

Some of the repeaters were trunked together, too; I was listening to 1000's of sq. km. worth of country, and never a peep. And I know I was getting out; the id's/squelch tails on those repeaters were about all I did hear. Sigh. Maybe the old boys don't want to chat with ve6pdq? (I'm not serious.)

And as far as getting a large number of new hams, I don't know what it would take. Dynamite the commercial TV stations, maybe ?? ;-).

Hello there.

I just recently started reading this group lately to see what the
noise level is up to.

Anyway, just a simple question. About a year ago, Los Angeles County
abondened their old 39meg assignments and jumped up to 470ish or so mHz.
In that wake, they should have left behind a few hundred (if not a
thousand) or so GE 'low-band' radios (the Mocom 70-like variety, for those
of you who can remember those old Motorola tanks). Does anybody know
what L.A. County did with all those radios. Usually, they're auctioned
off unless another agency needs those type of radios. They also
had a bunch of MX-300 series HT's for their (again) old 490mhz
assignments, though those might have been retuned down to 470, or
given to LAPD, since they used the same series on their HT's, though
LAPD HT's are 'turkey callers' (Auto ID'ers), and LASO's were not.

These GE monsters should be good for 6m, and they were 6-channel
models, so that should be plenty for the fairly empty vastness
of 6m..... [That should be good for a flame or two].

Hmmmm??? Anybody know?

Robert Gutierrez
NASA Science Internet Network Operations
Moffett Feild, California.

Check out Radiokit. They have several. A friend bought one, and said it was going together slowly, due to problems. They have a couple of 20 meter rigs, and a 15 meter, CW only, I think.

There's also an ad in CQ, page 49 in March, from Digitrex, showing a 8x2x6" multiband CW/SSB rig. If you get more information on this, I'd be interested in hearing about it. I called them once, and they said it was a super-het receiver.

As I understand it, the Canadian Digital class was restricted to packet only, i.e. no voice privileges to support coordinating and setting up packet operations, or just getting in contact with the rest of the ham population.

A lot of the 2 meter voice operation here is actually people talking about packet, and helping one another get set up and finding out what TNC settings they had wrong, etc.

I know I would not have had a Digital class license were I to be a Canadian citizen.

I have heard a number of about 1 watt per mile over fairly straight terrain for somewhat reliable communications, but have the following observations:

If the terrain is NOT ideal (i.e., hills block RF wonderfully), you will have to up the power (sometimes considerably).

Why fool around? In an emergency, I would think that the driving force would be reliability rather than cost.

You will probably want to look for which channel is not heavily used, since the less interference will extend the perceived range. (Your signal will have less to contend with.)

The maximum power level for CBs is extremely limited. I beleive the limit is still around 5 watts.

Based on this, I recommend that you go for a system of the full limit on allowed power (5 watts if you can), and then TEST THE SYSTEM by walking around (or having her walk around) and talk back to the base operator.

If that does not work, you may want to try a few things:

Get your base antenna (I hope you use as high a power station as allowed at the base too!) as high up as you can - definitely above the house roof.

If this still does not provide adequate coverage, you will have to go to another whole system: either cellular phone or have two people go for their ham license and use a ham repeater (hams can use higher power than CB operators).

The alternative of course is to warn her that the CB communication system only can be heard from such-and-such a distance.

Where there is a will, there is a way....

>looking for a copy of the schematic for the 2510, can anyone help?

Due to the problems with the chicken banders modifying these rigs for
CB/"freeband" use, the FCC made Uniden epoxy all PLL/VCO areas of the boards
to prevent tampering. They also decreed that all future designs (2600?) be
tamper proof as well. A copy of the service manual is available from Uniden
for $20.00, but again, all current units will be epoxied.

>
> I wouldn't buy anything from MFJ, and I don't buy anything from Rat Shack
> more complicated than batteries or speaker wire.

I used one of the MFJ clocks and didn't find any problems whatsoever with it.
I have also used the MFJ Noise Bridge and got excellent readings (as compared
to a professional unit) with it. Likewise, I had an MFJ-1274 (TNC2 clone)
and it worked flawlessly for three years, at which time I sold it to upgrade
to a Kantronics KAM.

I have a hard time understanding why people are so harsh on a company whose
workmanship may not be the best, but is certainly acceptable for Amateur Radio
work. Hams seem to have this extremely cynical attitude towards outfits
like MFJ and Radio Shack ("Rat Shack"). These outfits don't claim great
mean time between failures or anything of the sort. They are just trying to
provide products to electronic hobbyists at reasonable costs. And for what
I usually need, they suit me just fine.

Remember, you *usually* get what you pay for.

Source record: 13218

In article <5710006@hpcvra.CV.HP.COM> gregm@hpcvra.CV.HP.COM (Greg May) writes:
]
] Helical Resonator Question......
]
]I have a challenge for the masses on the net.....
]
]Here's my situation. The local club is trying to put up an autopatch
]on the local OSU 2M repeater, and we have run into a snag --- mainly "too much
]RF" from other sources on the hill. There is all kinds of stuff up there
]including a channel 7 TV signal, channel 25 and various sheriff repeaters,
]etc......
]
]Using a "hot" Hamtronics receiver on the hill and a 5 element beam as our
]link "to the hill" (because of the cost of "out of the way phone lines"),
]we are able to get a very solid signal to the hill. Using a handheld, the
]signal is perfect. Unfortunately, the Hamtronics likes all the other signals
]up their too. There is all kinds of intermod junk comming out of the 450
]receiver and audio "junk" is passed on the the 2M repeater input.
](The 440 handheld can also hear this stuff with squelch open --Heathkit)
]Now, we have found that with all the filtering (power lines, etc.) that 30db
]of attenuation on the front end of the 450 receiver (outside the box) cleaned
]up just about all the intermod (yes, you can still hear the 450 uplink).
]I personally did not hear this demonstration, but the general feeling in the
]group was that the helical resonator was the way to go. (My guess is we
]are running out of link signal at 30DB, and it is starting to get noisy.)
]We cannot/don't want to increase the 450 uplink signal at the transmitter.
]
]Now, the challenge for those who dare... Does anyone have information where
]I can get my hands on some articles to educate ourselves on these resonators.
]They sound interesting. I have one article but feel that I am still in the dark
]about the building technique. I think this would be the perfect opportunity
]for another club project.

Your problem is not unusual. The art of getting repeaters to work
in a high RF environment is not trivial. Let me suggest the following:

(1) If the intermod is being generated in your receiver, you have
three possibilities: (1) Get a better receiver, such as a commercial
radio (we use Micor's); (2) Put selectivity in front of your receiver
(more on that later); (3) Use PL tones on your receiver so that it won't
unsquelch on intermod.

(2) If the intermod is being generated in your transmitter, you have
one choice: FIX IT! Any transmitter generating intermod at a
significant level does not belong on a crowded site. There are

many commercial operators who oppose ham repeaters on commercial sites because hams often put up piles of junk that generate intermod. There are two techniques that come to mind for fixing intermod generating transmitters: (1) selectivity between the transmitter and the antenna; (2) use of a circulator so that signals cannot enter the transmitter and be mixed.

(3) If the intermod is being generated elsewhere, you need to find it and then fix it. Intermod is generated by any nonlinear device. We had one bad case that consisted of a guy cable rubbing against a struct. It was fixed by bonding it to the struct. We have another on a tall building in Phoenix (valley center) that comes from a section of the concrete parapet that was replaced with concrete built over a stretched metal frame, and the intermod comes from the rusting metal. We have been unable to fix this one!

Helical resonators, cavities, crystal filters: all narrow band devices. The standard for repeater sites is to use resonant cavities. These can be purchased (not cheaply), and have adjustable insertion loss and frequency. You can get pass or notch cavities. You should have a pass cavity on your transmitter (to be a good neighbor - it keeps the broadband noise from the transmitter from getting too far away from your frequency). A pass cavity (or more - in one case we used 5) on your receiver is a good idea, and will greatly help if the intermod problem is from within your receiver.

You can also use attenuation on your receiver. A third order intermod product will go down 3 dB for every 1 dB of attenuation that you put in front of your receiver. Of course, you don't want to use much attenuation on a repeater receiver.

I can give you more details by email if you want.

Let me re-iterate: If you are operating a ham repeater on a busy site and you don't have a circulator and a pass cavity on your transmitter, you are not being a good neighbor. If you try it at almost any site in Arizona, you will be shut down by the site owner (usually USFS or BLM) when they discover it. It is not "good amateur practice" to leave out these items on a shared site.

This is fortunately incorrect. Canadian Digital Amateur privs include
[AFP][0-59].* (in other words, all known modes) from 2 meters up. Below
2 meters, on the other hand, we have no privs whatsoever.

Regarding the last postings about helical resonators:

I remember a very nice article in the May '81 Annual Antenna Issue of "Ham Radio" about homebrewing cavity resonators. (There was an interesting suggestion how to make a "quick and dirty" cavity resonator for 2m. using an empty coffee can, a couple of coax connectors and other pieces of junk...).

The article may be usefull and include extra references.

Hope this will help.

(I'm recalling the year and month of the magazine from the doldrums of my memory... It used to work fine, but you know... Anyway, I'll double check the info later on at home, and publish an errata if the info is incorrect.)

Source record: 13222

A couple of weeks ago I posted a list of equipment manufacturers addresses and phone numbers. The intention was to disseminate the information, and to encourage anyone with further information to submit additions and corrections. There has been a little discussion about the availability of the information.

Some part of the material I listed, some of which had been compiled on a local system by one of the local club members, was taken from another source which should have credited Peter W. Kemp, KZ1Z, for compilation.

Please consider this a public apology to Mr. Kemp for not having properly credited him for his contribution. If you have downloaded a copy of the list, will you please add his name as a major contributor. If you have distributed the list to another board, will you please also copy this apology to that board.

I did not intend to slight Mr. Kemp for his due credit, but I was not at all diligent in tracing the source of the information. For that I apologize to him and to the Amateur Radio community.

Apparently the INFOHAMS posting appeared on CompuServe, either in the form of INFOHAMS DIGEST or otherwise. (I have not been on CompuServe for a while, so I do not know what form it took there.)

Please direct all questions or comments about items 11 through 22 on the list to:

1318. QRP rigs....

Newsgroup: rec.ham-radio
Date: 1990-02-26 18:31:08 UTC
From: Michael_Edelman%Wayne-MTS@um.cc.umich.edu
Message-ID: <204965@Wayne-MTS>
Source record: 13223

To the original poster who mentioned hand-held QRP sideband rigs: I don't know what Japanese company makes them, but AEA sells two VXO'd SSB/CW HTs for 10 meters and 6 meters. I had the 10M unit, and I'm sorta sorry I sold it. My first QSO outside the store was a W6 in San DIego. Pretty good for 2 watts two years ago.

Doug Faunt mentioned Digitrex. I've had their 9-band QRP rig on order since last October. Digitrex's ham business is a sideline to their instrumentation business, so things don't happen too fast there. The 9-band rig is a successor to their earlier monobanders, with selectable CW/DSB, digital readout, direct conversion recieve and 0-15W input. For the price (175 kit/ 250 assem.) it looks pretty good, if and when it comes out.

They've had a few problems they've been correcting based on feedback from the beta-test units in the field. There was a 31-meter image problem, and now there's a redesign of the final network going on. If everything is corrected and no other problems show up, I should have mine in about a month, I hope. I'll post a review if and when.

BTW, they make a couple of other nice products. One is a pocket sized freq counter for $60 (about .75"x1.5"x2") and a similarly sized one-channel rock bound FM 2M transmitter, intended to be used with scanner as an ultra simple 2M system. Might be interesting as the heart of an ultra-tiny packet system, too.

You understand WRONG!

A Digital certificate holder has all modes (including A1) on 2m
and up. They also get to do nifty things like P[0-9] that I, as
an Advanced certificate holder, can NOT do.

Hello Folks,
What is the best way to measure harmonics of radio gear? The ARRL handbook (1987 version), says that the best way is an attenuator in series with the COAX line from the Radio to the Spectrum Analyzer or by using a Dirctional Coupler.

Frankly I would be happy to measure in any way, but I do not own a attenuator that will take 100 Watts (let alone 1000 Watts) or a directional coupler.

Is there other ways that will yeild accurate results? I have thought about using a piece of wire wraped around the COAX, but this method is not accurate since the wire can go resonant at some frequencies (or can go more resonant), and yeild results that indicate the harmonic content is more than the fundamental.

I know that BIRD makes a high-power directional coupler, who knows what this costs. I was thinking of building a RF coupler that has been shown in the ARRL handbook that is used for SWR/Wattmeters....

What do you folks think? Any good sources for cheap test equipment like this?

> on the back connector etc. Any help would be appreciated. I hope to be

I have my TS-440 hooked to my PK-232 via ACC2. Yes, I use the mike mute
lead also. Drive the 440 PTT line AND mike mute lines with the PK-232
PTT output thru 2 switching diodes. Everything else is a direct connect.

Only 1 thing - the 440 wants a little higher audio level than the PK232
puts out, so the 440's mic gain (which works normally when feeding ACC2) needs
to be turned up to about 50% for proper levels (note - for voice operation,
my mike gain is set at about 25%).

Be careful soldering the 13 pin DIN connector - the plastic melts at low
temps and the pins move around.

Greetings.
I am not a ham radio operator but it was recommended by a friend who is
one that I post a note here to try and get some info.
The situation is that I want to get a few (2-5) approx. three watt transcivers
with two or three channels for use at summer camp, as such they need to be
portable (where portable is defined as under 5 lbs.).
The problem with walkie-talkies is the ones I have found (at Radio Shack)
are too expensive. What I would like to know is...
1. Who sells walkie talkies cheaper than Radio Shack ($50 for 3 watt, 3
channel rig)
1. Is there some clearinghouse of "used but working" equipment I could get?
2. Is there some clearinghouse of not-working-but-fixable equipment?
3. Is there some book/magazine/manual that would tell me how to build such
things?
4. Are CB's a reasonable option?

I do not read this board so please e-mail your responses to...

1324. HR2510 10meter rig mod

Newsgroup: rec.ham-radio
Date: 1990-02-26 23:23:20 UTC
From: rfc@briar.philips.com
Message-ID: <82874@philabs.Philips.Com>
Source record: 13129

copied from packet
From: kd6th@kd6th.nj.usa (reqfil)
Message-ID: <19567@KD6TH>

INFORMATION ON THE HR2510 10 METER RADIO

1: THE HR2510 USES A DRIVER AND FINAL IN CONJUCTION TO GIVING YOU FULL
25 WATTS ON SSB.

2: THE DRIVER IN THE HR2510 IS COMPLETELY INTERCHANGEABLE
WITH THE FINALS FOUND IN MOST RADIOS LIKE COBRA(2000GTL) AND THE
UNIDEN (710E) AND IT CAN HANDLE UP TO 20 WATTS OF POWER.
THE DRIVER IN THE HR2510 IS (2SC2166).

3: THE FINAL IN THE HR2510 IS A (MRF477) IT CAN HANDLE ABOUT 50 WATTS
OF POWER. THIS IS A FURTHER INDICATION THAT THE RADIO WAS BUILT FOR
POWER.

4: THE HR2510 HAS (AN612) BALANCE MODULATOR WHICH IS THE SAME FOUND IN
A COBRA (148GTL) CB RADIO.

5: THE HR2510 USES A (10 MHZ I.F.) LIKE THE COBRA (146GTL) CB RADIO.
AS A RESULT, THE RECEIVE IS VERY SIMILAR TO THE 146GTL CB RADIO.

6: THE HR2510 INSTEAD OF USING COILS, LIKE THE JACKSON RADIOS.
thE HR2510 UTILIZES A WIDE - BAND TOROIDAL TRANSFORMER AT
OUTPUTS TO ELIMINATE TUNING AND GET THE WIDE BANDWIDTHS NEEDED TO
OPERATE THE (26 MHZ TO 30 MHZ).

EXPANDED FREQUENCY COVERAGE FOR THE UNIDEN HR2510

THIS RADIO COVERS A FULL 26-30 MHZ WITH A SIMPLE 10-MINUTE CIRCUIT CHANGE.
NO FURTHER REALIGNMENT IS EVEN NEEDED, SINCE IT USES BROADBAND TUNING AND
WAS DESIGNED TO COVER ALL THIS RANGE IN THE FIRST PLACE.

PRODCEDURE:

1: LOCATE PINS 34 AND 35 OF THE MAIN UP CHIP IC315. (CALLED "UC1201A",
UC117", ETC.) THIS IS THE LARGEST CHIP ON THE SYNTHESIZER BOARD, PB121BB.

2: THESE PINS ARE GROUNDED ON THE HR2510 , BUT ARE TIED HIGH (5.0 VDC)
ON THE EUROPEAN MODELS LIKE THE PRESIDENT LIINCOLN. ALL THATS REQUIRED IS
TO BREAK THE GROUNDING PC TRACE AND TIE THEM INSTEAD TO A +5.0 VDC SOURCE
THROUGH A PULLUP RESISTOR.

3: ON THE SOLDER SIDE OF THE SYNTHESIZER PCB, YOULL NOTICE THAT PIN 34 AND
35 ARE SOLDERED TOGETHER AND ARE CONNECTED TO THE MAIN GROUND FOIL. USING

A RAZOR BLADE OR EXACTO KNIFE, CUT THE FOIL AT A NARROW SPOT TO BREAK THIS CONNECTION.

4: NOW NOTICE THAT THE LEFT-MOST PIN OF PULLUP RESISTOR PACK RR301 IS UNUSED AND GOES TO AN ISOLATED ISLAND FOIL PAD.(HOW COINCIDENTAL!) JUST TACK A SMALL JUMBER WIRE BETWEEN THIS PIN OF RR301 AND THE PAD OF IC315 PINS 34 AND 35, AND YOU'LL BE IN BUSINESS!

OK !

YOU NOW HAVE A RADIO USEFUL NOT ONLY FOR 10 METER HAM OPERATION, BUT ALSO FOR LISTENING* TO THE KIND OF ROAD INFORMATION AND EMERGENCIES FOR WHICH CB HAS PROVEN ITSELF REPEATEDLY. THE INDICATED COVERAGE ON THE FRONT PANEL WILL BE:

*don't transmit, this isn't a type accepted radio!

BAND A = 28.000 TO 28.490 MHZ
BAND E = 26.000 TO 26.490 MHZ
BAND B = 28.500 TO 28.990 MHZ
BAND F = 26.500 TO 26.490 MHZ
BAND C = 29.000 TO 29.490 MHZ
BAND G = 26.965 TO 27.405 MHZ
BAND D = 29.500 TO 29.990 MHZ
BAND H = 27.000 TO 27.490 MHZ
BAND I = 27.500 TO 27.990 MHZ

BAND "G" IS THE STANDARD CB BAND STARTS UP AT CH.9, 27.065 MHZ.

(Note: I haven't tried this, proceed at your own risk. And.....
DO NOT transmit outside of the Ham band!
(you don't want to loose your license!)

Use the above to listen only, or for use with a transverter.
Or use with a dummy load, to generate test signals for checking
receivers. WA2ISE)

>What is the best way to measure harmonics of radio gear?

A cheap way to detect the presence of harmonics, (if they are really strong!), is to use a low pass filter with a simple power meter. If you see significant change in power with the insertion/removal of the low-pass filter, then you probably have significant harmonic content in your signal. I have used this technique a lot at 10 GHz, where spectrum analyzers are expensive and hard to come by.

What is it about this forum that has people flaming each other before they even engage their brains??? It gives the non-ham readers a great perspective of us.

A case in point... In a recent basenote someone ask for information about an amplifier he had bought, and was about to use it on 11 meters. That had napalm coming out of every orifice on the net. Did anyone think that he was not aware of what he was doing?

I wrote him a friendly note relating what the limits were for 11 meters and what could happen if he were to use it, and get caught. I also said that this might be just the thing to get him interested in Amateur Radio.

He wrote back and was wanting all the information he could get on us Hams. His interest in radio had aways been strong, but he never made the contact with the Amateur community. He was very greatfull for the comments and said he was going to pursue his ticket.

I reminded him that not all hams that use this forum are A**holes and have the napalm storage option on their discs.

Re: lid filters

Maybe we need a more direct approach. Give each US ham three demerit votes. When a lid is encountered, the ham sends a demerit vote to the FCC. If a lid receives more than three demerits per year from different hams, the lid loses their license for a while. Yes, it could be abused, but the abusers would lose their licenses, too.

Re: memorization

I memorized my way to a BSEE. The multiple-guess tests are no different than what goes on in colleges across the country. The only difference is that hams memorize Ohms Law, while engineering students derive it from Maxwell's equations.

It would be better if the VECs could mix up the a/b/c/d order, though. Fill-in-the-blank would be the next step.

As I understand it, we (US hams) have quite a bit of leeway from the FCC. If we want to change the question pool, or the format of the test, I think the opinion of the ARRL and US hams would carry some weight.

I have the 949C tuner. Now that I've built an amplifier capable of 300W (the 949C's limit), I find that I burn out switch contacts if I use full rated power on it.

I guess I'll have to find rig up a pair of 6-position ceramic (aka REAL) RF switches. I am a little disappointed, but not entirely surprised.

kantronics makes some monoband hf equipment, but from the picture it looked closer to mobile-sized rather than ht-sized. also, i recall they delivered a bit more than qrp power, perhaps 25W. i saw them in the ege (now haro) catalog.

also, aea makes a 10m, large-ht-sized qrp radios which include a built-on antenna. i'm not sure what other bands (if any) are available.

>
> This is fortunately incorrect. Canadian Digital Amateur privs include
> [AFP][0-59].* (in other words, all known modes) from 2 meters up. Below
> 2 meters, on the other hand, we have no privs whatsoever.

Ah... so unless there are some other unusual or unacceptable restrictions,
then this license class does suffer from lack of publicity. Of course
being "south of the border" I would not know much about it (as my above
ignorance shows) but had THAT existed when I was in high school here, I
would have been a ham 14 years earlier than I did.

It might be curious to see who can bring in the most hams in the US when
the nocode license becomes a reality.

So a "Digital" ham in Canada can go buy a 2 meter HT and call up any other
ham over the local 2 meter repeater?

1331. How does one build LOG AMPS (>60dB dynamic range)

Newsgroup: rec.ham-radio
Date: 1990-02-27 01:47:04 UTC
From: GMoretti@massey.ac.nz
Message-ID: <596@massey.ac.nz>
Source record: 13136
Cross-posted to: rec.ham-radio,sci.electronics

I've build a spectrum analyser (0-100MHz) that has a 10.7MHz IF (from HAM-RADIO years ago) and it works quite well but I'm not happy with the log-amp/detector.

The detector at 10.7MHz is cascade of amplifier stages each with the same gain (10dB) and a diode halfwave detector from each stage. The outputs of the detector are summed. Unfortunately it needs a lot preset pots to get it working correctly and its linearity is not as high as I'd like.

Also I'd like to try making a direct conversion spectrum analyser - it would need to be DC coupled. The log detector would then run at a much lower frequency. I've tried using S-meter output of a CA3089 and its logarithmic but doesn't have the required dynamic range (> 60dB).

How does one make real log amps that don't need lots of preset adjustment?

Ideas ??

Giovanni

As the discussion of the merits/foibles of the no-code proposal rage on, I've seen numerous discussions of how existing Novices and Techs should be grandfathered into the *new* licensing structure. Well, I think the FCC will be inclined to grant little beyond exam credit for elements passed (i.e. you will get credit for those exam elements already passed, but no additional privleges). They will also be inclined to preserve the existing privleges even though the license classes in question may disappear.

So, if you are inclined to believe that Techs will be grandfathered to general, DON'T HOLD YOUR BREATH!!! If the past is any indication, it ain't going to happen. Look at what happened to Techs after *Novice Enhancement*: The *old* Techs got NO extra priv's outside of what was given to the Novice class, but they are given credit for passing elements 3A and 3B.

If ever the FCC had an excuse to grandfather the old Techs to general, this was it, in that the ONLY difference between an old Tech and a General was the code requirement. It's been a popular myth that someday the FCC would grandfather Techs to General. This myth has been around longer than I have been a ham (13 yrs), and still presists. But, the FCC never did, and I have serious doubts that they will!

As far as I'm concerned, there should be only two license classes:

1. All privleges (bands, modes, power, etc) 50 MHz and above.

2. All privleges, All bands.

The second license would only require obtaining a CW endorsement (to satsify ITU regs) to the ticket granted above (1). The theory tests would be IDENTICAL (!!!). This would get us back to a very simple licensing structure, much easier to administer than the current (and some proposed) scheme.

Of course, this will, in all probability, never come about. Incentive licensing has done more to stratify the amateur population in the US than anything I can think of. If a simplified licensing structure such as what I have illustrated above were ever to come up for consideration, the objections raised by those factions (and they know who they are) determined to protect their turf, so to speak, would doom it to defeat in short order. Incentive licensing was a BAD idea in 1964, and it's still a bad idea today.

Regardless of what happens to the existing classes, the success or failure of the no-code license depends on a couple of factors. First, they must be integrated into the VHF mainstream. This means access to 2 meters (at least, 6 would be super along with 2). Face it, the vast majority of operation at VHF is conducted on 2 meter FM (I don't want to start a flame war or to denegrate the users of any other VHF band or mode, but have you ever tried to work 2m SSB away from populated areas when the band's not open?)

Second, for the benefit of all concerned, we NEED to clean up our collective act in regard to operating practices. We all could be a little more courteous and considerate of others when operating. Most of the problems on 20 meter phone could be cured with a healthy does of courtesy and common sense. If/when no-code becomes a reality, we are going to have to set a good example for the new ops to avoid chaos (we're already setting a good example for the newcommers, right???).

FCC Docket Number 90-55 Page 1

Before the
Federal Communications Commission
Washington, D.C. 20554

PR Docket No. 90-55

In the Matter of
Amendment of Part 97 of the RM-6984 RM-6985
Commission's Rules Concerning RM-6986 RM-6987
the Establishment of a Codeless RM-6988 RM-6989
Class of Amateur Operator License RM-6990 RM-6991
RM-6992 RM-6993
RM-6994 RM-6995

NOTICE OF PROPOSED RULE MAKING

Adopted: February 8, 1990; Released: February 16, 1990

By the Commission:

I. INTRODUCTION

1. In this Notice of Proposed Rule Making (Notice), we propose to establish a new class of amateur operator license that would not require the applicant to prove that he or she can send and receive manual Morse code telegraphy messages. This proceeding was initiated by twelve petitions for rule making filed on matters generally relating to amateur operator license class structure, requirements and privileges.(1)

II. BACKGROUND

2. The amateur service exists for the purpose of self-training, intercommunication and technical investigations carried out by duly authorized persons interested in radio technique solely with a personal aim and without pecuniary interest.(2) Article 32 of the international Radio Regulations requires, among other things, that each person seeking a license to operate the apparatus of an amateur station prove that he or she has the ability to send correctly by hand to receive correctly by ear text in Morse code signals. Although this requirement may be waived for an operator of an amateur station transmitting only on frequencies above 30 MHz(3), each of the five classes of operator

licenses issued by the Commission(4) requires the applicant to pass an examination in the international Morse code.(5)

3. Over the years, the Commission has received requests from persons who want to pursue the purposes of the amateur service, but who argue that Morse code telegraphy is an unnecessary barrier to obtaining a license. Historically, however, the amateur community has strongly supported a telegraphy skill requirement for every class of amateur operator license. In a 1974 rule making proceeding(6), and again in a 1983 rule making proceeding(7), amateur licensees showed nearly unanimous opposition to proposals for a no-code license.

4. In the 1974 rule making proceeding, we proposed an overall restructuring of the classes of amateur operator license. Included in those proposals was the establishment of a codeless class of license. Although it resulted in several improvements to the license structure, the proceeding was terminated without action on the codeless license class.(8) It was during the pendency of this proceeding that the computer-aided license application processing system currently in use was developed. The capability for processing a sixth class of license, therefore, was incorporated into the design for the system. In the 1983 rule making proceeding, the Commission again sought ways to provide a class of codeless license. One proposal was the deletion of the slow speed telegraphy examination requirement for the Technician Class license.(9) The alternative proposal was a new operator license class patterned after a Canadian codeless class of amateur license, and having very difficult written examination requirements. The proceeding was also strongly opposed by the amateur community and was terminated without action.(10) The above-listed petitions initiating this proceeding, however, indicate that the sentiment in the amateur community now appears to favor a codeless license class. The ARRL, for example, states that it now supports a codeless license as being "beneficial to the future, short and long term, of the Amateur Service."(11) The issue of a codeless class of amateur operator license, therefore, should be considered in light of current circumstances in the amateur service.

III. DISCUSSION

5. A significant segment of the amateur community has a new view of the role of telegraphy in the future of the service. David Stall states that "numerous recent surveys have demonstrated that the concept of a no-code license is rapidly attracting a wide base of support within the amateur community."(12) The ARRL states that its recent studies show:

Encouraged by changes in the FCC rules, packet radio and other digital modes have become extremely popular and have led to amateur radio becoming increasingly attractive to computer-literate individuals who pssess the ability to contribute significantly to the service, but who fail to perceive the relevance of the manual Morse code. Many amateurs welcome the idea of providing a gateway to these individuals. The possibility now exists to dispassionately evaluate a codeless amateur license on its own merits. It is this factor that accounts for what the League perceives as a significant shift in attitudes among amateurs toward a codeless amateur license.(13)

FCC Docket Number 90-55 Page 3

6. The SCATG states that the time is right for a codeless class of license:

Morse code operations were once the only way to make radio communications possible. It is now just a facet of an entire spectrum of possible methods of radio communications. It is no longer in keeping with the basis and purpose of the Amateur Radio service and to stress one facet of radio communications over all others. Knowledge of code doesn't eliminate rules violations or uncourteous operations.(14)

7. Burt Fisher, a teacher of electronics at a regional high school, states "the public need would best be served if there were a door into amateur radio that had a limited code requirement. Once in the door, these youngsters would be tempted to the rest of the world (and technology) of amateur radio. The public would be served as the base of potential scientists and technicians would be enhanced..." He believes that a written examination could be used to ascertain that an entry level license applicant has knowledge of telegraphy.(15) Michael Trahos believes that it is essential to have a codeless beginner license so that the amateur service will not stagnate or experience a decrease in the number of licensees. He believes that if a codeless license is not established, the number of licensed amateur operators will decrease, with a consequent increasing re-allocation of amateur service spectrum by the Commission to the land mobile services.(16)

8. John McCord believes a codeless classs of license would "attract many young minds to the hobby of amateur radio..."(17) Dennis and Linda Welch find the issue of a codeless class of license contentious and defended mostly by the older amateurs and championed by the very population needed for expansion.(18) Bill Welsh, who has a personal preference for code operation, foresees "that its years as a realistic amateur radio licensing requirement are coming to an end."(19) James E. Taylor states that telegraphy is no longer necessary and that the number of amateur operators must be drastically increased in order to

"continue to justify our existence."(20) Clement Bourgeois, however, disagrees. He states that a knowledge of telegraphy by every amateur operator is essential. He does believe, however, that the high speed telegraphy examination(21) should be reduced to 15 words-per-minute or less.(22) Larry Ballentine suggests that telegraphy examinations only require the examinee to recognize telegraphy characters, rather than to send and receive text at specific rates of speed.(23)

9. Operator License Structure. The petitions espouse various views on the structure of the license ladder. The general consensus, however, is that a codeless class of license should be the beginning step on the ladder. The ARRL believes that there is nothing antiquated or irrelevant about the Morse code, or its use in the Amateur Radio Service, but that this is a "matter that some individuals must learn for themselves, in order

to appreciate that relevance."(24) Most of the petitions favor a structure that avoids any negative effect upon any current licensee. One approach would add a sixth class of operator license modeled after the Novice Class, without the telegraphy requirement. He believes that a codeless license should provide "a no-code entry into amateur radio without disrupting the existing classes, privileges, or incentives."(25) Burt Fisher also favors the sixth class approach,(26) as does ARRL, with the codeless class positioned in the license structure so that there is an upward path "to the present Technician license by way of a five words per minute More code examination..."(27)

10. Another approach taken in the petitions is to preserve the current five class structure by conversion of the Novice Class to a codeless class. John McCord, for example, recommends elimination of the telegraphy requirement for the Novice license.(28) In addition to conversion of the Novice Class, Dennis and Linda Welch also suggest a merger of the Technician and General Classes.(29) The SCATG recommends that the Novice Class be gradually replaced by a non-renewable codeless class that would "minimally disrupt the existing license structure to avoid disenfranchising current licensees. ...[t]he new license should avoid isolating the newcomer from the mainstream of amateur radio operators and operations while maintaining the incentive to upgrade and providing attractive privileges for the newcomer...."(30)

11. Other petitions suggest major revisions to the license class structure. James Taylor states that prospective amateur operators "are put off by the present complex, layered structure of our hobby..." He suggests one all-purpose operator class.(31) Alan Horowitz suggests "a no-code ham license, similar to Canada's license structure."(32) Michael Trahos, however, states

that "[t]he Canadian no-code experience has clearly shown that creation of a no-code license class with examination requirements greater than that of the lowest available code license class fails to promote interest in, or insignificantly increases, the number of licensed amateur radio operators."(33) He suggests, instead, two new codeless classes.(34) Bill Welsh believes that emission mode privileges should be earned "by passing written and on-the-air operating tests that are directly related to the desired additional emission/mode privilege being sought."(35) He suggests that all frequency segments no offered as incentives be eliminated.(36)

12. Operator privileges. The petitions generally concur that, as a minimum, a station control operator holding a codeless class of license be authorized all emission privileges on the 1.25 meter (m) and shorter wavelength bands. For the longer wavelength bands, however, there are several views, starting with James Taylor's recommendation that all possible privileges be authorized to the codeless class.(37) Michael Trahos and SCATG recommend including the 6 m and 2 m bands.(38) Burt Fisher recommends authorizing the 52-54 MHz segment in the 6 m band. He also recommends include the 2 m band, but excluding emission F3E

on that band.(39) The ARRL recommends excluding operation on both the 6 m and 2 m bands.(40) Dennis and Linda Welch,(41) David Stall,(42) and John McCord make recommendations similar to those of the ARRL. John McCord, however, suggests including digital type emission privileges on the 6 m and 2 m bands.(43)

13. The petitions recommend that the eligibility for the codeless class of license, like all amateur operator licenses, require the passing of a written examination. The ARRL states that the written examination should reflect the privileges to be earned and require a greater commitment than does the present Technician class written examination. It believes that the lessons learned from codeless license programs in other countries necessitate a significant written examination. The ARRL recommends, therefore, that a written examination for the codeless license be administered under the Volunteer Examiner Coordinator (VEC) system. The ARRL also recommends a 60 question written examination consisting of the current 55 question written examination for the Technician Class Operator license, augmented by five additional questions related to the specific privileges afforded the codeless licensees. Two of the new questions would be concerned with the application and use of telegraphy and the remainder would be concerned with digital communication techniques.(44) The SCATG states that the written examination should consist of 50 questions.(45)

14. The petitions also suggest names for a new codeless class of license. The SCATG suggests "Apprentice."(46) Burt Fisher suggests "Novice-V."(47) Michael Trahos suggests "Novice-Plus" and "Technician-Plus."(48) David Stall suggests "Limited."(49) The ARRL states that its suggested name "Communicator," although "not exactly reflective of the type of license envisioned in the proposal... is, however, the most descriptive among those alternatives considered."(50)

IV. PROPOSAL

15. We believe that the petitions have merit. Further, like the petitioners, we believe that this is a propitious time to propose the establishment of a codeless license, given the advances in electronic communications in the past few years. We propose, therefore, to establish a codeless class of amateur operator license, the Communicator Class. With respect to this proposed operator class, we have established three objectives. Our first objective is to offer an entry level license opportunity to all persons who find the telegraphy requirement a barrier to pursuing the purposes of the amateur service. Our view is best expressed by the statement of the ARRL that "the goal of the codeless amateur license is to bring such licensees in to the 'mainstreem' of the Amateur Radio Service, and to encourage them to upgrade their license class."(51) Our second objective is to propose a type of license that can be implemented quickly if a decision is made to proceed. Our third objective is to avoid any negative effect upon current licensees, upon the work of the volunteer examiners, or upon the Commission's

1335. FCC PR Docket 90-55 Part 2/4

Newsgroup: rec.ham-radio
Date: 1990-02-27 04:11:55 UTC

cut here

FCC Docket Number 90-55 Page 6

workload and resources. To preclude any impact on our resources, it is imperative that our existing computer-aided application processing system be utilized "as is."(52) The proposed rule amendments are contained in the attached Appendix.

16. In proposed Sections 97.501 and 97.503(b)(1), we would require that the applicant for a Communicator Class license pass a 60 question written examination, as requested by ARRL. In sum, there would be an expanded entry level examination and corresponding question pool. We concur with ARRL that the written examination for the Communicator Class License should correspond to the privileges for that class of license.(53) The new question pool would be comprised of questions from the two pools currently used in the Novice and Technician license examinations, and new questions as requested by ARRL.(54) By incorporating existing questions, over 91 percent of the question pool for a Communicator Class license would already be available and would help facilitate a smooth transition.(55)

17. Operator license structure. In proposed Section 97.9, we would incorporate the Communicator Class in a simplified license structure containing four ascending steps: Communicator, General, Advanced, and Amateur Extra Classes. Current Technician and Novice Class operator licenses would be grandfathered indefinitely. There would be no new licenses issued for those license classes, but existing licenses could be modified or renewed. This approach would meet the objectives we established in paragraph 15. Dennis and Linda Welch, John McCord and SCATG suggested preserving the five-step ladder by eliminating the telegraphy examination requirement from the Novice class license. This approach deserves careful consideration by the amateur community because of its simplicity. We did not propose this approach because of its disadvantage of lowering the license qualification standards for the Novice operator class. As such, it may be unacceptable to the hundreds of thousands of amateur operators, included the 85,000 current Novice Class licensees, who qualified for the Novice licence by passing a telegraphy examination. The Novice Class has operating privileges below 30 MHz, necessitating the need for a knowledge of telegraphy as described in paragraph 2.

18. For future licensees, the Communicator Class license would be the first step in the license structure instead of the Novice Class. Our premise is that most newcomers to the service, given the choice, would elect to qualify for the Communicator Class license rather than the Novice Class license. There would, therefore, no longer be a need for the Novice Class license, We particularly invite instructors, volunteer examiners (VEs), and VECs to submit comments on the validity of this premise, including factual information on the time and effort that would be required for persons to prepare tor the proposed 60 question Communicator Class written examination as compared to the time and effort currently required for the Novice Class 30 question written examination and telegraphy examination.

19. Because the written examination for the Communicator Class license would be more comprehensive than that of the Technician Class license, the Communicator Class would also serve in the stead of the Technician Class for future licensees. Each step in the proposed four step structure provides recognition that the holder has significantly advanced his or her skill in both the communication and technical phases of the radio art.(56) This structure could be rapidly implemented. The present license application processing system and license application form would continue to be used.(57)

20. Operator Privileges. The proposed control operator privileges of the Communicator Class would generally be those suggested by the ARRL. The privileges would include all authorized emission types. The proposed transmitter power standard would be 200 watts peak envelope power. The licensee's station would be eligible for a Group D call sign.(58) Stations with Communicator Class control operators would not be permitted to transmit on the 2 m and 6 m bands. In view of ARRL's desire to bring the codeless class into the mainstream of the amateur service,(59) however, we particularly invite comment on the effect of excluding Communicator Class licensees from these two popular bands.

21. The ARRL stated that one premise for its petition was that an accommodation should be made for codeless class licensees to upgrade their license class. It cited countries that have codeless licenses where the written examination tests the examinee's technical qualifications. The ARRL stated that amateur service societies in countries such as Australia, the Federal Republic of Germany, and Belgium report ongoing telegraphy activities among the codeless class licensees working to upgrade the license class.(60) While the proposed Communicator Class privileges include telegraphy on the 1.25 meter and shorter wavelength bands, we recognize that telegraphy operation is more closely assiciated with the HF bands. The

opportunity for newcomers to the amateur service actually to send and receive messages in the Morse code on small segments of the HF 80, 40, 15, and 10 meter bands is provided to the Novice and Technician Classes so that those operators can gain an appreciation of telegraphy tand acquire the proficiency needed to pass the telegraphy examination for the General Class operator license. We specifically request comments, therefore, concerning the desirability of including the opportunity for Communicator Class licensees also to experience on-the-air telegraphy operation on the HF bands. In view of our obligation under the provisions of the international Radio Regulations,(61) if it is desired, only domestic communications on the HF bands would be authorized.

22. Under proposed Section 97.301(g), a Communicator Class licensee who passes, or otherwise receives credit for a telegraphy examination, would be authorized the additional privileges of the Technician Class.(62) To avoid a license processing burden, however, the documentation of the passing of,

or credit for, a telegraphy examination would be evidenced by the Certificate of Successful Completion of Examination (CSCE) issued by the administering VEs,(63) rather than by the issuance of a Technician Operator license. Theindicator used by the Communicator Class for identification purposes would be AC.(64) Under propsed Section 97.505(a)(1), VEs would be authorized to grant examination credit, evidenced by a CSCE, to a Communicator Class examinee for the slow speed telegraphy examination when the examinee holds a Novice Operator license.(65) That combination, Communicator Class license and CSCE, would permit the Communicator Class licensee the same rights and privileges of the Technician Class operator. The VECs would provide listings, in paper or magnetic for, of the Communicator Class licensees who have been issued the CSCE.

23. Volunteer examiners. The instant proposal contains substantive changes in the amateur operator license examination procedure and the issuance of amateur operator licenses and CSCEs. All operator license examinations would be administered under the VEC system.(66) The additional task of administering the Communicator Class would be offset by the elimination of other tasks, included the discontinuance of the two-examiner system for the Novice Class license.(67) The coorination and oversight by the VECs provide more credible results than does the two examiner system. In the latter, examination administration errors are more common and cheating is a greater problem than in the VEC system. The task of administering new Technician Operator Class licenses would also be discontinued.(68) The Novice and Technician written examinations would no longer be

prepared and adminsisted as separate examinations. The VEs and VECs, moreover, coulb e reimbursed for out-of-pocket costs incurred in connection with all examinations.(69)

V. CONCLUSION

24. We believe that this proposal would achieve the objectives set forth in paragraph 15 above. We seek comments, therefore, on the proposed revisions to Part 97 to establish a Communicator Class Operator license for the amateur service, as set forth in the attached Appendix.

VI. PROCEDURAL MATTERS

25. For purposes of this non-restricted notice and comment rule making proceeding, members of the public are advised that ex parte presentations are permitted except during the Sunshine Agenda period. Se generally 47 C.F.R. & 1.1206(a). The Sunshine Agenda period is the period of time which commences with the release of a public notice that a matter has been placed on the Sunshine Agenda and terminates when the Commission (1) releases the text of a decision or order in the matter; (2) issues a public notice stating that the matter has been deleted from the Sunshine Agenda; or (3) issues a public notice stating that the matter has been returned to the staff for further consideration, whichever occurs first. 47 C.F.R. & 1.202(f). During the Sunshine agenda period, no presentation, ex parte or otherwise, are permitted unless specifically requested by commission or staff for the clarification or adduction of evidence or the resolution of issues in the proceeding. 47 C.F.R. & 1.1203.

26. In general, an ex parte presentation is any presentation directed to the merits or outcome of the proceeding made to decision-making personnel which (1) if writte, is not served on the parties to the proceeding, or (2), if oral, is made without advance notice to the parties to the proceeding and without opportunity for them to be present. 47 C.F.R. & 1.1202(b). Any person who makes or submits a written ex parte presentation shall provide on the same day it submitted two copies of same under separate cover to the Commission's Secretary for inclusion in the public record. The presentation (as well as any transmittal letter) must clearly indicate on its face the docket number of the particular proceeding to which it relates and the fact that two copies of it have been submitted to the Secretary, and must be labeled or captioned as an ex parte presentation. 47 C.F.R. & 1.1206

27. Any person who is making an oral ex parte presentation and presents data or arguments no already reflected in that person's written comments, memoranda, or other previous filings

in that proceeding shall provide on the day of the oral presentation an original and one copy of a written memorandum to the Secretary (with a copy to the Commissioner or staff member involved) which summarizes the data and arguments. The memorandum (as well as any transmittal letter) must clearly indicate on its face the docket number of the particular proceeding and the fact that an original and one copy of it have been submitted to the Secretary, and must be labeled or captioned as an ex parte presentation. 47 C.F.R. & 1.1206.

28. Authority for issuance of this Notice is contained in Sections 4(i) and 303(l) and (r) of the Communications Act of 1934, as amended. 47 U.S.C. && 154(i) and 303(l) and (r). Pursuant to applicable procedures set forth in Sections 1.415 and 1.419 of the Commission's Rules, 47 C.F.R. && 1.415 and 1.419, intested parties may file comments on or before August 6, 1990,

1336. Re: How does one build LOG AMPS (>60dB dynamic range)

Newsgroup: rec.ham-radio
Date: 1990-02-27 04:29:42 UTC
From: whit@milton.acs.washington.edu
Message-ID: <2154@milton.acs.washington.edu>
Source record: 13141

In article <596@massey.ac.nz> GMoretti@massey.ac.nz (Giovanni Moretti) writes:
>I've build a spectrum analyser (0-100MHz) that has a 10.7MHz IF (from
>HAM-RADIO years ago) and it works quite well but I'm not happy with the
>log-amp/detector.

Most log amps use the relationship that the base-emitter voltage
of a transistor is proportional to the logarithm of the emitter current
(sometimes approximated as the collector current). A good low-noise transistor
will follow this "ideal diode" curve for about eight orders of magnitude
in the collector current (power ratio 160 dB). Routine use of this
effect is complicated by the temperature dependence of the equation,
Ie= Is * exp(q* Vbe/(k * T))
and a good logarithm amplifier either needs a second (matched) transistor
at the same temperature to set the operating point, or a thermostat.
The National Semiconductor Linear Applications databook has one
thermostat-style solution, in AN-264. The thermostat they use employs
three transistors, with one transistor doing the logarithm conversion,
a second measuring the temperature, and a third acting as the heater.
The thermostat approach does NOT require matched transistors.
The second approach, with matched transistors is slightly
less accurate (mainly because of mismatched emitter resistances at
elevated currents), but works at lower total power dissipation. I think
the National databook has one of these, also; AN-29, Figure 23.
I would suggest using the cookbook circuits, since at the lowest
current ranges these are not terribly easy to frequency-compensate (i.e.
the op amps will likely oscillate), and these circuits have
already been debugged.
The second part of your problem is the precise rectification of
the IF-frequency signal; all I can think of is a good hot-carrier
diode, and keeping 60 dB of accuracy there is not going to be easy.
Good luck.
Your local National Semiconductor distributor (or the
representatives in Australia: telephone (03) 729-6333) can
supply the application notes I quoted above.

I am known for my brilliance, John Whitmore
by those who do not know me well.

1337. FCC PR Docket 90-55 Part 3/4

FCC Docket Number 90-55 Page 10

and reply comments on or before September 7, 1990. All relevant and timely comments will be considered by the the Commission before final action is taken in this proceeding. To file formally in this proceeding, participants must file an original and four copies of all comments and reply comments. If participants want each Commissioner to receive copies of their comments, an original and nine copies must be filed. Comments and reply comments must state the proceeding to which they relate (PR Docket Number). They should be sent to the Secretary, Federal Communications Commission, Washington, D.C. 20554. Comments and reply comments will be available for public inspection during regular business hours in the Dockets Reference Room (Room 239) of the Federal Communications Commission, 1919 M Street N.W., Washington, D.C. 20554.

29. In accordance with Section 605 of the Regulatory Flexibility Act of 1980, 5 U.S.C. & 605, the Commission certifies that these rules would not, if proulgated, have a significant economic impact on a substantial number of small entities, because these entities may not use an amateur station to transmit any communication the purpose of which is facilitate the business or commercial affairs of any party. See 47 C.F.R. & 97.113(a). Moreover, the proposed rules would not require the use of or significantly enhance the sale of any additional amateur station apparatus.

30. The proposal contained herein has been analyzed with respect to the Paperwork Reduction Act of 1980, 44 U.S.C. & 3501 et seq., and found to increase the information collection burden which the Commission imposes on the public. This proposed increase in the information collection burden is subject to approval by the Office of Management nd Budget as prescribed by the Act.

31. A copy of the Notice will be forwarded to the Chief Counsel for Advocacy of the Small Business Administration.

FEDERAL COMMUNICATIONS COMMISSION

Donna R. Searcy
Secretary

APPENDIX

Part 97 of Chapter I of Title 47 of the Code of Federal Regulation is proposed to be amended as follows:

1. The authority citation for Part 97 continues to read as follows:

Authority citation: 48 Stat. 1066, 1082, as amended; 47 U.S.C. & 303. Interpret or apply 48 Stat. 1064-1068, 1081-1105, as amended; 47 U.S.C. && 301-609, unless otherwise noted.

2. Section 97.9 is revised to read as follows:

& 97.9 Operator License

(a) The classes of operator licenses are Communicator, General, Advanced, and Amateur Extra. There are also two grandfathered classes of operator licenses, Novice and Technician. An operator license authorizes the holder to be the control operator of a station with the privileges of operator class specified on the license. The license document or a photocopy thereof must be in the personal possession of the licensee at all times when the person is the control operator of a station.

(b) A person holding a Communicator Class operator license and who holds a CSCE indicating that the person passed element 1(A), 1(B), or 1(C) is authorized to exercise the rights and privileges of the Technician Class for the duration of the license and renewal thereof.

(c) A person holding a Novice, Technician, Communicator, General, or Advanced Class operator license who has properly filed with the FCC an application for a higher operator class that has not yet been acted upon, and who holds a CSCE indicating that the person passed the necessary examinations within the previous 365 days is authorized to exercise the rights and privileges of the higher operator class.

3. Section 97.17(a) is revised to read as follows:

& 97.17 Application for new license.

(a) Any qualified person is eligible to apply for an amateur service license. No new Novice or Technician Class operator licenses will be issued.

* * * * *

4. Section & 97.119(e) is revised to read as follows:

& 97.119 Station Identification.

* * * * *

(e) When the control operator is using privileges on the basis of holding a CSCE, an indicator must be included after the call sign as follows:

(1) AC for Communicator Class Operator;
(2) AG for General Class Operator;
(3) AA for Advanced Class Operator;
(4) AE for Amateur Extra Class operator.

* * * * *

FCC Docket Number 90-55 Page 13

5. Section 97.301(a) is revised and a new paragraph (g) is added to read as follows:

& 97.301 Authorized Frequency Bands.

* * * * *

(a) For a station having a control operator holding a Technician, Communicator, General, Advanced or Amateur Extra Class operator license:

Wave- length band	ITU Region 1 See & 97.303 Paragraph:	ITU Region 2	ITU Region 3	Sharing requirements
VHF	MHz	MHz	MHz	
1.25 m	---	222-225	---	(a).(b).(e)
UHF	MHz	MHz	MHz	
70 cm	430-440	420-450	420-450	(a).(b).(f)
33 cm	---	902-928	---	(a).(b).(g)
23 cm	1240-1300	1240-1300	1240-1300	(j)
13 cm	2300-2310	2300-2310	2300-2310	(a).(b).(j)
-do-	2390-2450	2390-2450	2390-2450	(a).(b).(j)
SHF	GHz	GHz	GHz	
9 cm	---	3.3-3.5	3.3-3.5	(a).(b).(k).(l)
5 cm	5.650-5.850	5.650-5.925	5.650-5.850	(a).(b).(m)
3 cm	10.00-10.50	10.00-10.50	10.00-10.50	(b).(c).(i).(n)
1.2 cm	24.00-24.25	24.00-24.25	24.00-24.25	(a).(b).(i).(o)
EHF	GHz	GHz	GHz	
6 mm	47.0-47.2	47.0-47.2	47.0-47.2	
4 mm	75.5-81.0	75.5-81.0	75.5-81.0	(b).(c).(h)
2.5 mm	119.98-120.02	119.98-120.02	119.98-120.02	(k).(p)
2 mm	142-149	142-149	142-149	(b).(c).(h).(k)
1 mm	241-250	241-250	241-250	(b).(c).(h).(q)
---	above 300	above 300	above 300	(k)

* * * * *

(g) For a station having a control operator holding a Technician, General, Advanced or Amateur Extra Class operator license:

Wave- length band	ITU Region 1 See & 97.303 Paragraph:	ITU Region 2	ITU Region 3	Sharing requirements
VHF	MHz	MHz	MHz	
6 m	---	50-54	50-54	(a)
2 m	144-146	144-148	144-148	(a)

6. Section 97.501 revised to read as follows:

& 97.501 Qualifying for an amateur operator license.

An applicant must successfully pass an examination for the issuance of a new amateur operator license and for each change in the operator class. Each applicant for the class of operator license specified below must pass, or otherwise receive examination credit for, the following examination elements.

(a) Amateur Extra Class operator: Element 1(C), and elements 3(A), 3(B), 4(A), and 4(B);

(b) Advanced Class operator: Element 1(B) or 1(C), and elements 3(A), 3(B), and 4(A);

(c) General Class operator: Element 1(B) or 1(C), and elements 3(A), and 3(B);

(d) Communicator Class operator: Element 3(A).

7. Paragraphs (b) and (c) of Section 97.503 are revised to read as follows:

& 97.503 Element Standards.

* * * * *

(b) A written examination must be such as to prove that the examinee possesses the operational and technical qualifications required to perform properly the duties of an amateur service licensee. Each written examination must be comprised of a question set as follows:

(1) Element 3(A): 60 questions concerning the privileges of a Communicator Class operator license. The minimum passing score is 45 questions answered correctly.

(2) Element 3(B): 25 questions concerning the additional privileges of a General Class operator license. The minimum passing score is 19 questions answered correctly.

(3) Element 4(A): 50 questions concerning the additional privileges of an Advanced Class operator license. The minimum passing score is 37 questions answered correctly.

(4) Element 4(B): 40 questions concerning the additional privileges of an Amateur Extra Class operator license. The minimum passing score is 30 questions answered correctly.

FCC Docket Number 90-55 Page 15

(c) The topicls and number of questions required in each question set are listed below for the appropriate examination element:

Topics	Element: 3 (A)	3 (B)	4 (A)	4 (B)
(1) FCC rules for the amateur radio services	15	4	6	8
(2) Amateur Station operating procedures	7	3	1	4
(3) Radio wave propagation characteristics of amateur service frequency bands	4	3	2	2
(4) Amateur radio practices	11	5	4	4
(5) Electrical principles as applied to amateur station equipment	6	2	10	6
(6) Amateur Station equipment circuit components	4	1	6	4
(7) Practical circuits employed in amateur station equipment	3	1	10	4
(8) Signals and emissions transmitted by amateur stations	4	2	6	4
(9) Amateur station antennas and feed lines	6	4	5	4

8. Section 97.505(a) is revised to read as follows:

& 97.505 Element credit.

(a) The administering VEs must give credit as specified below to an examinee holding any of the following documents:

(1) An unexpired (or within the renewal grace period) FCC-issued Novice Class operator license: Element 1(A) and the 30 written questions in Element 3(A) based upon the material from the written examination passed for the Novice Class operator license.

(2) An unexpired (or within the renewal grace period) FCC-issued Communicator Class operator license: Element 3(A).

(3) An unexpired (or within the renewal grace period) FCC-issued Technician Class operator license: Element 3(A).

FCC Docket Number 90-55 Page 16

(4) An unexpired (or within the renewal grace period) FCC-issued Technician Class operator license issued before March 21, 1987: Elements 3(A) and 3(B).

(5) An unexpired (or within the renewal grace period) FCC-issued General Class operator license: Elements 1(B), 3(A), and 3(B).

(6) An unexpired (or within the renewal grace period) FCC-issued Advanced Class operator license: Elements 3(A), 3(B), and 4(A).

(7) A CSCE: Each element the CSCE indicates the exmanee passed within the previous 365 days.

(8) An unexpired (or within the renewal grace period) FCC-issued commercial radiotelegraph operator license or permit: Element 1(C).

* * * * *

9. Section 97.507 is revised to read as follows:

& 97.507 Preparing an Examination.

(a) Each telegraphy message and each written question set administered to an examinee must be prepared by a VE holding an FCC-issued Amateur Extra Class operator license. A telegraphy message or written question set, however, may also be prepared for the following elements by a VE holding an FCC-issued operator license of the Class indicated:

(1) Element 3(B): Advanced Class operator.

(2) Elements 1(A) and 3(A): Advanced or General Class operator.

(b) Each question set administered to an examinee must utilize questions taken from the applicable question pool.

(c) Each telegraphy message and each written question set administered to an examinee for a Communicator, General,

Advanced or Amateur Extra Class operator license must be prepared, or obtained from a supplier, by administering VEs according to instructions from the coordinating VEC.

(d) A telegraphy examination must consist of a message sent in the international Morse code at no less than the prescribed speed for a minimum of 5 minutes. The message must contain each required telegraphy character at least once. No message known to the examinee my be administered in a telegraphy examination. Each 5 letters of the alphabet must be counted as 1 word. Each numeral, punchuation mark and prosign must be counted as 2 letters of the alphabet.

1338. Re: How does one build LOG AMPS (>60dB dynamic range)

Newsgroup: rec.ham-radio
Date: 1990-02-27 05:26:03 UTC
From: johnw@watnext.waterloo.edu
Message-ID: <13547@watcgl.waterloo.edu>

Cross-posted to: rec.ham-radio,sci.electronics

A fellow from New Zeland wanted to know how to go about assembling a log amp. Probabley the easiest way is to get an Intersil ICL8048. I needs two resistors, a small 180pf cap and +/- 15 V and you're in business. It has 120 dB dynamic range for current input and 60 dB for voltage input.

The voltage is just turned into current. The voltage precision is then limited by the offsets of its internal op-amps. You can build wider range circuits discretely with either chopper stabilized and /or low Ib op amps but the jump in cost and time from this chip in performance is about 5x money and 30x time.

For you information: log amps and anti-log amps exploit the relationship that for a bipolar transistor Veb varies as the log of Ic. The chip packages it all very nicely for you. Analog Devices also has several entries in this field, but they are hybrids vs Intersil monolithics which translates to higher cost.

I've used the chip, it's cute.

John Wieczorek

cut here

FCC Docket Number 90-55 Page 17

10. In Section 97.511, the heading and the text are revised to read as follows:

& 97.511 Operator license examination.

(a) Each session where an examination is administered must be coordinated by a VEC. Each administering VE must be accredited by the coordinating VEC.

(b) Each examination for a Communicator Class operator license must be administered by 3 administering VEs, each of whom must hold an FCC-issued Amateur Extra or Advanced Class operator license.

(c) Each examination for a General, Advanced or Amateur Extra Class operator license must be administered by 3 administering VEs, each of whom must hold an FCC-issued Amateur Extra Class operator license.

(d) The administering VEs must make a public announcement before administering an examination. The number of candidates at any exmination may be limited.

(e) The administering VEs must issue a CSCE to an examinee who scores a passing grade on an examination element.

(f) Within 10 days of the administration of a successful examination, the administering VEs must submit the application to the coordinating VEC.

11. Section 97.513 is removed.

12. In Section 97.519, new paragraph (d) is added to read as follows:

& 97.519 Coordinating examination sessions.

* * * * *

(d) Each coordinating VEC must compile lists of Communicator Class operator licenses who have been issued a CSCE for Element 1(A), 1(B), or 1(C) during each calendar month. The VEC must forward a copy of the list to the Private Radio Bureau, FCC, Washington, DC 20554, by the 10th day following

the end of the month.

13. Section 97.527 is amended by revising paragraph (a), removing paragraph (c) and redesignating paragraphs (d) (e) (f) and (g) as (c) (d) (e) and (f) to read as follows:

& 97.527 Reimbursement for expenses.

(a) VEs and VECs my be reimbursed by examinees for out-of-pocket expenses incurred in preparing, processing, administering, or coordinating an examination.

FCC Docket Number 90-55 Page 18

FOOTNOTES

(1) The petitions were received from the American Radio Relay League, Inc. (ARRL) (RM-6995), Larry Ballentine (RM-6991), Clement Bourgeois, Jr. (RM-6988), Burt Fisher (RM-6989), Alan Horowitz (RM-6984), John M. McCord (RM-6993), the Space Coast Amateur Technical Group (SCATG) (RM-6986), David K. Stall (RM-6994), James E. Taylor (RM-6985), Michael C. Trahos (RM-6990), Dennis and Linda Welch (RM-2987), and Bill Welsh (RM-6992). Subsequent to the Public Notice listing of the foregoing petitions, two additional petitions addressing the same matter were received from Larry Garens and Philip Howard. These petitions are included in the record of this notice and comment proceeding and will be given full consideration prior to a final determination in this matter.

(2) See No. 53 of the International Telecommunication Union Radio Regulations (geneva, 1979) (hereafter Radio Regulations). See also 47 U.S.C. & 153(q).

(3) See No. 2735 of the Radio Regulations.

(4) The license classes are, in ascending steps, Novice, Technician, General, Advanced and Amateur Extra.

(5) The examinations cover three levels of telegraphy skill. They are 5, 13, and 20 words-per-minute. The examinee must also pass certain written examination elements, depending upon the operator license class sought. See Sections 97.501 and 97.503 of the Commission's Rules, 47 C.F.R. && 97.501 and 97.503.

(47) RM-6989 at 1.
(48) RM-6990 at 20.

(49) RM-6994 at 1.
(50) RM-6995 at 17.
(51) RM-6995 at 19.
(52) The sixth license class designation is "Communicator."
(53) A written examination must be designed to demonstrate that the examinee has the operational and technical qualifications required to perform properly the duties of an amateur service licensee in accordance with the privileges authorized by the class of operator license sought. See 47 U.S.C. & 303(1)(1) and 47 C.F.R. & 97.503(b).

(54) Section 97.523, 47 C.F.R. & 97.523, requireds all VECs to cooperate in maintaining one question pool for each written examination element. Each pool must contain at least 10 times the number of questions required for a single examination.

FCC Docket Number 90-55 Page 20

(55) The current Technician Class question pool consists of 250 questions. There are currently 300 questions in the Novice Class question pool. An additional 50 question would be added, giving the proposed Communicator Class question pool a total of 600 questions.

(56) See Section 97.1(c), 47 C.F.R. & 97.1(c).

(57) Until a revised FCC Form 610 becomes available, the administering VEs would write in certain information on the current form in the case of an application for a Communicator Operator license. We would furnish information to the VECs for temporary use of the current form, if we decide to proceed with the Communicator Class license.

(58) The computer-aided application processing system selects a new call sign from four basic groupings for assignment to an amateur station. Each call sign is sequentially selected from an alphabetized region-group list that corresponds to the licensee's class of operator license and mailing address.

(59) RM-6995 at 19.
(60) RM-6995 at 14.

(61) See Radio Regulations, Nos. 2735 and 2736.

(62) The additional privileges include RTTY and data emissions and phone emissions J3E and R3E in a segment of the 10 meter band, and all authorized emissions in the 2 and 6 meter bands. See && 97.301 and 97.303.

(63) A Certificate of Successful Completion of Examination is now issued by VEs. See Section 97.511(e), 47 C.F.R. & 97.511(e).

(64) Section 97.119(e) requires that an indicator must be included after the call sign whenever the control operator is

using privileges based on hold a CSCE. The indicator AC is proposed for the Communicator Class.

(65) Currently, Section 97.505(a)(2), 47 C.F.R. & 97.505(a)(2), requires VEs to give credit to an examinee holding a certificate of successful examination (CSCE) indicating the examination was passed within the previous 365 days. Currently, Section 97.9(b), 47 C.F.R. 97.9(b), authorizes a licensee holding a CSCE indicating that he or she has completed the necessary examinations within the privious 365 days to exercise the rights and privileges of the higher operator class. The time limitation that would apply to the use of a CSCE in conjunction with the Communicator Class license authorizing the rights and privileges of the Technician Class would be the duration of the license term and renewal thereof.

FCC Docket Number 90-55 Page 21

(66) Eighteen organizations function as VECs. They accredit VEs, coordinate examination sessions, maintain the question pools, provide instructions to VEs, review and forward completed license application forms to the Commission for processing. Some 50,000 examinations are administered annually under the VEC system.

(67) Some 18,000 to 20,000 persons qualify for a Novice Operator Class license annually. The examinations are administered by two General, Advanced, or Amateur Extra Operator Class licensees selected by the examinee.

(68) Some 10,000 to 15,000 persons qualify for the Technician Operator Class license annually.

(69) Currently, VEs and VEC may only be reimbursed by examinees for expenses incurred in preparing, processing, administering or coordinating an examination for a Technician, General, Advanced, or Amateur Extra Class Operator license. See 47 U.S.C. & 154(f)(4)(J) and 47 C.F.R. & 97.527.

1340. Re: Bearcat 200XLT Mod

Newsgroup: rec.ham-radio

Randall J. Davis writes:
BTW: I thought the mod was to *add* a resister, not cut one out....

Bob Parnass responded:
Wrong.

Ok, now I'm confused (easily so I guess). I just received one of these (BC200XLT) via Grove. It makes my PRO34 look and feel very wimpy - how much are PRO34's worth on the used market? Grove included instructions that ADD a 2-10k resistor from pin 8 of one of the K1013 ICs down to a resistor adjacent to IC UC-1147. The mod seems to work, though I don't have enough working experience with the radio to know if I've lost some other operation.

Are there two way to make this mod? If so, what's the "better" way? Hacking out a resistor may cause slightly less power drain (but harder to undo)? I've just started a _Monitoring Times_ subscription, can anyone recommend a back issue article to read related to this?

>
I've done the following to sense if I have a significant problem with harmonics in 2 meter rigs: I found that cable-ready TV sets' channel 35 tunes around 292 Mhz, which is the 2nd harmonic of 146 Mhz. Connect the TV to an outside antenna, or rabbit ears (disconnect the catv). Key up the rig under test. See if you see any signal on the TV (you should see something, a clean rig will still produce a few uVolts which the TV will pick-up.) Compare the first rig with another one (like a commercial made HT). If you get similar signal strengths, you're *probably* OK. If you produce a big whopping signal with the rig under test, you know what that means!
Anyone know who lives around 292Mhz?

WRONG, WRONG, WRONG!!!!
Those who have only the digital license will NOT be grandfathered into
the Advanced license. They will only get VHF and above.
Those who currently hold the Amateur license (theory, regs and 10wpm) will
be grandfathered into the Advanced license.

Another inexpensive source for a useful logger is the Motorola
MC3356 and MC13055 FSK receiver ICs. These are really complete receivers
including i-f amplification, log output, squelch and data recovery
circuits but are in the $2 rice range. The log output seems to be pretty
straight over a 60-70 dB range and the chip works pretty well at inputs
up to 50 MHz or so. The MC3356 also has an oscillator (may be crystal
controlled or tuned) and mixer built into it too so that the device
makes pretty good material for a very-poor-man's spectrum analyzer.

>directional coupler.

But wait! Surely you have a dummy load! You're not going to test
this equipment on the air are you? (Unless you're looking for external
intermod, or such). A dummy load is the most expensive part of a
"power attenuator". You don't need a precise amount of attenuation,
since you're not measuring absolute power, but rather the relative power
of the harmonics to the fundamental.

Here's a circuit you might try adding to your dummy load:

```
R2
Atten in from xmtr >-------/\/\/\------< Atten out, to spectrum analyzer.
| |
| |
\ \
/R1 / R3
\ \
/ /
| |
GND GND
```

R1: existing 50 ohm dummy load.
R2: 2400 ohm, 2W carbon comp (or other non-inductive resistor
i.e. not wirewound)
R3: 50 ohm 1/4 watt resistor

This circuit should give about 40dB of attenuation and handle 100 W.
Keep all leads very short. Keep input and output as separate as possible.
If possible, put a sheet metal shield between R1 and R3, with a hole for R2.
I have something like this inside the little minibox on top of my
Heath Cantenna, which replaces the diode detector circuit Heath supplies.

Happy testing!

AEA makes a 10 meter and 6 meter HT that is xtal controlled. I think the frequency can be pushed about 50 KHz with a tuning knob on the top and there is provision for 2 crystals. I vaguely rember the price at $300. AEA called it the DX-HANDY. Either 73 or QST reviewed it last summer. Reviewer had a QSO from Calif. while standing in his back yard (in New York State) with the whip antenna supplied with the rig.

I hope this helps,

Stan

Dissident group to broadcast from ship

A radio station calling itself the "Voice of Democracy in China" will begin broadcasting from April 20 from a ship in international waters off China, the Federation for Democracy in China said yesterday.

Wu'erkaixi, a leader of the pro-democracy student movement who now lives in the United States, will head a team of young radio amateurs who plan to give a
^^^^^^^^^^^^^^
round-the-clock service that will reach all of Chinese territory.

The radio will broadcast on medium-wave from a 1,140 tonne ship formerly used by Britain for geo-physical research. It will be officially baptised the Goddess of Democracy when it is launched from the French port of La Rochelle on March 9.

The ship is being named after the version of the Statue of Liberty which students erected in Beijing's Tiananmen Square beofore the tanks moved in last June.

The launch will be broadcast by satellite. International recording artists are cutting a disc for the occassion and a world wide, 24-hour concert is planned to mark the first anniversary of the massacre in Tiananmen Square on June 4, the FDC said.

The FDC and the magazine Actuel sponsored the operation "Fax peace in China" four months ago, whereby the democratic movement telefaxed documents to machines capable of receiving them in China. Beijing reacted furiously to the initiative.

Some 15 European magazines are sponsoring the Goddess of Democracy.

The FDC was founded near Paris last November by dissidents from Beijing in exile in France, the United States and elsewhere.

Agence France Presse

Found this on the scc newsgroup. I don't suppose that the above "radio amateurs" are hams? Anyway, something for SWLs to DX.

Some people are dyslexic and mentally cannot learn the code. I have two friends that barely made 5 wpm. One of them is now contributing to the hobby in a big way - he used to be a microwave engineer at Hewlett-Packard back when >1 GHz was leading edge. Both of these guys would have joined while in high school, had the CW requirement been eased.

> This "lower-the-
> water" instead of raise the bridge attitude just smacks of lack
> of dicipline.

I agree. Learning 5 wpm is just a matter of time and patience for most people. The difficulty is determining when someone has tried hard enough, then having the wisdom to "let them in" in spite of their not attaining 5 wpm. I'd rather give the VECs a little leeway here, rather than lowering the water level.

>long walks as part of her recovery and treatment. This winter, while out
>walking, she slipped and broke her arm some distance from the nearest house.
>While this was not life threatening it caused her some distress.

This is an emergency situation. For emergency communications, use any
frequency and any amount of power you wish.

There are several commercially-available "medical alert" products out -
maybe a local hospital can help you there. The most reliable short haul
communications is VHF, but doesn't work well around hills. You need
line-of-sight to make it reliable. Portable cellular telephone is
a possibility, if the tranciever is small enough.

Emergency use of an amateur 2 meter repeater is a possibility - you
might want to contact a local amateur repeater group to see if it would
suit your needs. I know that I wouldn't mind having the repeater used
by an elderly lady with a broken arm. There are several commercially
available walkie-talkies that can be easily carried, and the smallest
batteries would last long enough.

Citizen Band walkie talkies would be ok about half the time. We're at
the maximum of the sunspot cycle now, so I fear your mom's 5 watts would
be drowned out by some clown in Louisiana running 2 kilowatts.

From: dana@lando.la.locus.com.la.locus.com
Message-ID: <4308@oolong.la.locus.com>
Source record: 13161

I currently hold an Advanced class license. Back when I lived in a house where I could erect a reasonable antenna, over 2/3 of all my contacts were on HF using CW. I've only ever worked CW on frequencies above 54 Mhz once :-).

Morse code has been a buddy. I don't use it at all now, but I'd hate to see it go. It seems that politcal conditions will conspire to retain CW as a prerequisite to legal HF operation for some time (maybe the next WARC will toss it out?). For illegal operation, CW does nothing. Any lid can dial 7255 on his TS-140S and jam WESCARS regardless of whether CW exists or not. It isn't the requirement of CW which has kept HF less prone to jamming than 2m, it is the relative cost and practicality of the equipment.

CW has been a like a secret handshake for hams. You don't need any computer gear to use it (unlike any of the other popular digital modes) and you can learn it easily. Every Field Day I've ever been to has had someone come driving in honking their horn "CQ FD DE W6CX" or something. At one time, CW was the appropriate requirement for entry into the amateur ranks.

But, the state of the art has really moved on, and we've got all sorts of new things to play with. CW has little to do with any of them. By easing the CW requirement and increasing the technical (theory) requirement, we could enjoy a new growth in the ham community which would benefit us all. Maybe then the secret handshake will be jargon like "Bell 202" and "HDLC" and "AX.25" and even phrases like "pseudo-noise transmitter". For folks who don't know or care about these things, it'll be like AM vs. SSB was, followed by AM vs FM. CW will continue to be one of the best high noise path modes, SSB will still be extremely popular, and the new modes will just be icing on the cake.

Dissident group to broadcast from ship

A radio station calling itself the "Voice of Democracy in China" will begin broadcasting from April 20 from a ship in international waters off China, the Federation for Democracy in China said yesterday.

Wu'erkaixi, a leader of the pro-democracy student movement who now lives in the United States, will head a team of young radio amateurs who plan to give a
^^^^^^^^^^^^^^
round-the-clock service that will reach all of Chinese territory.

The radio will broadcast on medium-wave from a 1,140 tonne ship formerly used by Britain for geo-physical research. It will be officially baptised the Goddess of Democracy when it is launched from the French port of La Rochelle on March 9.

The ship is being named after the version of the Statue of Liberty which students erected in Beijing's Tiananmen Square beofore the tanks moved in last June.

The launch will be broadcast by satellite. International recording artists are cutting a disc for the occassion and a world wide, 24-hour concert is planned to mark the first anniversary of the massacre in Tiananmen Square on June 4, the FDC said.

The FDC and the magazine Actuel sponsored the operation "Fax peace in China" four months ago, whereby the democratic movement telefaxed documents to machines capable of receiving them in China. Beijing reacted furiously to the initiative.

Some 15 European magazines are sponsoring the Goddess of Democracy.

The FDC was founded near Paris last November by dissidents from Beijing in exile in France, the United States and elsewhere.

Agence France Presse

Found this on the scc newsgroup. I don't suppose that the above "radio amateurs" are hams? Anyway, something for SWLs to DX.

Source record: 13164

> Tests are imperfect ways to measure things. Would you feel much better
> knowing that Pilot's Licenses (including airline pilots) include
> multiple-choice, memorizable tests?

However, to put this in perspective, there is a difference between this situation and the written ham exam. Before you can take the Pilot's License written exam, you must have the approval of a Certified Flight Instructor. Such approval is not likely to be forthcoming until after extensive ground school training; with your Instructor satisfied you are knowledgeable and ready.

If we are going to rely solely on written knowledge testing for obtaining a ham license, and IF we want that test to be a valid measure of knowledge, than improvements in the tests need to be made. Some have noted that one can easily memorize the current answers to the tests. The problem is worst than that. Memorization is not required. The tests only require recognition. For example, do you want someone to pass a current written ham test with an hour of study? Try this: Get a copy of the current test question and answer pool, and type up all the answers on a separate piece of paper. Give that sheet of paper to someone with the instructions to read over the list, and if they recognize any of the answers on the test, then mark them as correct. I suspect they will pass without further study because of the poor psychometric qualities of the test. For example, few if any of the correct answers serve as distracters (i.e. where the correct answers are also incorrect answers to other questions).

1360. Atlantis heard during launch

Newsgroup: rec.ham-radio
Date: 1990-02-28 08:12:53 UTC
From: karn@ka9q.bellcore.com
Message-ID: <20405@bellcore.bellcore.com>
Source record: 13165
Cross-posted to: rec.ham-radio,sci.space.shuttle

I heard UHF air-to-ground communications during this morning's launch of Atlantis on its "secret" shuttle mission. I heard a total of four very brief transmissions, all on a frequency of 259.7 MHz (the "secondary" UHF comm frequency listed in the press kits). The first transmission heard here in northern NJ was at about 2:59:30 AM EST, and the last was at 3:01:14. The last message clearly said "APU shutdown on time"; this seems right given that the launch had occurred about 10 minutes earlier.

Among other things, my ability to hear the shuttle at this location confirms the high inclination orbit.

Message-ID: <1690@crash.cts.com>
Source record: 13166

Anyone know about the "Message Transfer" or "Message Forwarding" feature now being touted in the upper-end answering machines?

I'm looking for a machine that will automaticly call my Bravo pager and send some pre-programed digits so that I know that a msg has been left on my machine. Specificly, will they send the extra digits after some delay after dialing the pager phone number, will they send the pound sign as the pager terminator, will they dial and alternate phone number, etc, etc, etc.

Being basicly a cheapo type individual, I am trying to save the $15 change that the pager company charges for voice mail/paging. I have a Code-a-Phone 2555 now. An antique I know, but has excellent audio quality and smooth remote control. Don't really want to give it up, but the monthly savings will soon pay for the handy, dandy, late model do-dads that are out in the high-end market.

E-mail fine but, if it will flow, let's do it here... ...Mike

I have been receiving inquiries from people who own or are considering the purchase of an older Bearcat BC-300 scanner, so reposting this article seems like the right thing to do.

x
DON'T JUNK THAT OLD BEARCAT BC-300

by Bob Parnass, AJ9S

Although the Bearcat BC-300 scanner is no longer available, it occupies a fond place in my collection. I exercise little self control when I see a used BC-300 for sale cheap, and have adopted two broken units. They make fine radios after repair.

The BC-300 was the forerunner of today's 760XLT. It was a 50 channel feature laden scanner, introduced around 1979, back when Bearcat was part of Electra. Retail sales of the BC-300 continued until 1987, when it was discontinued by Uniden.

Although Electra offered the pricey BC-350 as a step above the BC-300, firmware bugs and a batch of bad power transformers doomed the 350, and the 300 remained the jewel of Bearcat line.

It's easy to see why the BC-300 model was offered for several years. It boasted premium features like a clock, a carrier operated solid state relay for tape recorder activation, a transmission counter, and a Service Search of 11 ROM banks of preprogrammed channels. For memory, the BC-300 used EAROM (electronically alterable read only memory), so backup batteries were not necessary. The Dog House, a radio shop in Fairfax, Virginia, at one time offered the DH 1000, a 1,000 channel adapter for the BC-300! Unfortunately for federal band listeners, the BC-300 lacked coverage of the 138-144 and 406-420 MHz bands.

While outwardly impressive, internal construction was typical of Electra hand wiring in that era -- a bit messy. BC-300 schematics show at least 100 components changed between earliest and later units. The scanner went through many circuit design changes, but rather than changing the printed circuit board, new components were tack soldered on

the foil side in different positions.

Electra stamped all of its scanners with a manufacturing date code on the rear of the cabinet. The code is comprised of a single character (C = Cumberland, Indiana, P = Puerto Rico), followed by four digits denoting year and week the radio was built. For example, "P2284" denotes the radio was made in the Puerto Rico factory during the 22nd week of 1984.

Switching power supply failure was common in early units due to insufficient capacitance. Electra responded by increasing the value of capacitor C98 from 22 ufd/16 v to 47 ufd/25 v, but I recommend 47 ufd/35 v. If your display is getting abnormally dim, C98 is probably the culprit, as it was in five Bearcat scanners I fixed.

Squelch preset potentiometer R81, mounted on the radio circuit board, was misadjusted in new units, requiring readjustment after the components aged.

In one radio, I replaced Q9, a small signal PNP transistor. Its failure caused the BC-300 to become deaf on all but the UHF band. Failure of squelch gate transistor Q15 caused the squelch to remain open at all times.

Cold solder joints, especially on the wires and ribbon cable connecting the radio board to the logic board, have been responsible for other failures.

I have seen serious IC failures in three BC-300s built around 1984. These include CPU chip IC201, memory chip IC202, and IC203, not in stock at your your local Radio ShackO.

The BC-300 circuitry, especially on the radio board, is very similar to the circuitry in the the BC-220, BC-20/20, BC210XL, and BC-350, so some of the previous remarks may be applicable to these models as well.

I can neither furnish schematics nor repair your radio. If you come across a broken BC-300, obtain a schematic from Uniden and spend some time troubleshooting. If you give up, your BC-300 can be fixed by Electronic Repair Centers in Franklin Park, Illinois, (312)455-5105. I'm told they do good work. The BC-300 is a classic scanner and worthy of your efforts.

Looking at the schematic for the Bearcat 200XLT, Pin 8 is a switched Vcc line which supplies the K1013 chips. They are using it supply Vcc for a pullup line which drags the SKIP(NOT) pin of the high. The resistor which others say needs to be cut pulls the SKIP(NOT) line to ground (or low enough to look like a logic 0).

Other information in the schematic describes the SKIP(NOT) line as "with pull-up MOS". This suggests to me that the line has an internal pullup resistor, so that removing the 10K pulldown should be sufficient. But I'm not an engineer, so Grove may have its reasons. The added current drain from a 10K resistor is insignificant.

I don't know if you both have to be portable or not. If one doesn't have to be, it would be better to get an outside antenna 20 or 30 feet above the roof and connect the walkie talkie to it.

Brute force power is no substitute for a good antenna.

I would buy the maximum legal power (which is 5 watts, I believe).
The CB frequencies can have huge amounts of QRM, either local or
via skywave. In fact, I wonder if a portable radio would be a reliable
link over 2.5 miles, considering the potential interference.

and reply comments on or before September 7, 1990. All relevant and timely comments will be considered by the the Commission before final action is taken in this proceeding. To file formally in this proceeding, participants must file an original and four copies of all comments and reply comments. If participants want each Commissioner to receive copies of their comments, an original and nine copies must be filed. Comments and reply comments must state the proceeding to which they relate (PR Docket Number). They should be sent to the Secretary, Federal Communications Commission, Washington, D.C. 20554. Comments and reply comments will be available for public inspection during regular business hours in the Dockets Reference Room (Room 239) of the Federal Communications Commission, 1919 M Street N.W., Washington, D.C. 20554.

29. In accordance with Section 605 of the Regulatory Flexibility Act of 1980, 5 U.S.C. & 605, the Commission certifies that these rules would not, if proulgated, have a significant economic impact on a substantial number of small entities, because these entities may not use an amateur station to transmit any communication the purpose of which is facilitate the business or commercial affairs of any party. See 47 C.F.R. & 97.113(a). Moreover, the proposed rules would not require the use of or significantly enhance the sale of any additional amateur station apparatus.

30. The proposal contained herein has been analyzed with respect to the Paperwork Reduction Act of 1980, 44 U.S.C. & 3501 et seq., and found to increase the information collection burden which the Commission imposes on the public. This proposed increase in the information collection burden is subject to approval by the Office of Management nd Budget as prescribed by the Act.

31. A copy of the Notice will be forwarded to the Chief Counsel for Advocacy of the Small Business Administration.

FEDERAL COMMUNICATIONS COMMISSION

Donna R. Searcy
Secretary

FCC Docket Number 90-55 Page 11

APPENDIX

Part 97 of Chapter I of Title 47 of the Code of Federal Regulation is proposed to be amended as follows:

1. The authority citation for Part 97 continues to read as follows:

Authority citation: 48 Stat. 1066, 1082, as amended; 47 U.S.C. & 303. Interpret or apply 48 Stat. 1064-1068, 1081-1105, as amended; 47 U.S.C. && 301-609, unless otherwise noted.

2. Section 97.9 is revised to read as follows:

& 97.9 Operator License

(a) The classes of operator licenses are Communicator, General, Advanced, and Amateur Extra. There are also two grandfathered classes of operator licenses, Novice and Technician. An operator license authorizes the holder to be the control operator of a station with the privileges of operator class specified on the license. The license document or a photocopy thereof must be in the personal possession of the licensee at all times when the person is the control operator of a station.

(b) A person holding a Communicator Class operator license and who holds a CSCE indicating that the person passed element 1(A), 1(B), or 1(C) is authorized to exercise the rights and privileges of the Technician Class for the duration of the license and renewal thereof.

(c) A person holding a Novice, Technician, Communicator, General, or Advanced Class operator license who has properly filed with the FCC an application for a higher operator class that has not yet been acted upon, and who holds a CSCE indicating that the person passed the necessary examinations within the previous 365 days is authorized to exercise the rights and privileges of the higher operator class.

3. Section 97.17(a) is revised to read as follows:

& 97.17 Application for new license.

(a) Any qualified person is eligible to apply for an amateur service license. No new Novice or Technician Class operator licenses will be issued.

* * * * *

FCC Docket Number 90-55 Page 12

4. Section & 97.119(e) is revised to read as follows:

& 97.119 Station Identification.

* * * * *

(e) When the control operator is using privileges on the basis of holding a CSCE, an indicator must be included after the call sign as follows:

(1) AC for Communicator Class Operator;
(2) AG for General Class Operator;
(3) AA for Advanced Class Operator;
(4) AE for Amateur Extra Class operator.

* * * * *

5. Section 97.301(a) is revised and a new paragraph (g) is added to read as follows:

& 97.301 Authorized Frequency Bands.

* * * * *

(a) For a station having a control operator holding a Technician, Communicator, General, Advanced or Amateur Extra Class operator license:

Wave- length band	ITU Region 1 See Paragraph:	ITU Region 2	ITU Region 3	Sharing requirements & 97.303
VHF	MHz	MHz	MHz	
1.25 m	---	222-225	---	(a).(b).(e)

(g) For a station having a control operator holding a Technician, General, Advanced or Amateur Extra Class operator license:

Wave- ITU ITU ITU Sharing
length Region 1 Region 2 Region 3 requirements
band See & 97.303
Paragraph:

VHF MHz MHz MHz
6 m --- 50-54 50-54 (a)
2 m 144-146 144-148 144-148 (a)

6. Section 97.501 revised to read as follows:

& 97.501 Qualifying for an amateur operator license.

An applicant must successfully pass an examination for the issuance of a new amateur operator license and for each change in the operator class. Each applicant for the class of operator license specified below must pass, or otherwise receive examination credit for, the following examination elements.

(a) Amateur Extra Class operator: Element 1(C), and elements 3(A), 3(B), 4(A), and 4(B);

(b) Advanced Class operator: Element 1(B) or 1(C), and elements 3(A), 3(B), and 4(A);

(c) General Class operator: Element 1(B) or 1(C), and elements 3(A), and 3(B);

(d) Communicator Class operator: Element 3(A).

7. Paragraphs (b) and (c) of Section 97.503 are revised to read as follows:

& 97.503 Element Standards.

* * * * *

(b) A written examination must be such as to prove that the examinee possesses the operational and technical qualifications required to perform properly the duties of an amateur service licensee. Each written examination must be comprised of a question set as follows:

(1) Element 3(A): 60 questions concerning the privileges of a Communicator Class operator license. The minimum passing score is 45 questions answered correctly.

(2) Element 3(B): 25 questions concerning the additional privileges of a General Class operator license. The minimum passing score is 19 questions answered correctly.

(3) Element 4(A): 50 questions concerning the additional privileges of an Advanced Class operator license. The minimum passing score is 37 questions answered correctly.

(4) Element 4(B): 40 questions concerning the additional privileges of an Amateur Extra Class operator license. The minimum passing score is 30 questions answered correctly.

FCC Docket Number 90-55 Page 15

(c) The topicls and number of questions required in each question set are listed below for the appropriate examination element:

Topics	Element:		
3	3	4	4
(A)	(B)	(A)	(B)
(1) FCC rules for the amateur radio services	15	4	6	8
(2) Amateur Station operating procedures	7	3	1	4
(3) Radio wave propagation characteristics of amateur service frequency bands	4	3	2	2
(4) Amateur radio practices	11	5	4	4
(5) Electrical principles as applied to amateur station equipment	6	2	10	6
(6) Amateur Station equipment circuit components	4	1	6	4
(7) Practical circuits employed in amateur station equipment	3	1	10	4
(8) Signals and emissions transmitted by amateur stations	4	2	6	4
(9) Amateur station antennas and feed lines	6	4	5	4

8. Section 97.505(a) is revised to read as follows:

& 97.505 Element credit.

(a) The administering VEs must give credit as specified below to an examinee holding any of the following documents:

(1) An unexpired (or within the renewal grace period) FCC-issued Novice Class operator license: Element 1(A) and the 30 written questions in Element 3(A) based upon the material from the written examination passed for the Novice Class operator license.

(2) An unexpired (or within the renewal grace period) FCC-issued Communicator Class operator license: Element 3(A).

(3) An unexpired (or within the renewal grace period) FCC-issued Technician Class operator license: Element 3(A).

FCC Docket Number 90-55 Page 16

(4) An unexpired (or within the renewal grace period) FCC-issued Technician Class operator license issued before March 21, 1987: Elements 3(A) and 3(B).

(5) An unexpired (or within the renewal grace period) FCC-issued General Class operator license: Elements 1(B), 3(A), and 3(B).

(6) An unexpired (or within the renewal grace period) FCC-issued Advanced Class operator license: Elements 3(A), 3(B), and 4(A).

(7) A CSCE: Each element the CSCE indicates the exmanee passed within the previous 365 days.

(8) An unexpired (or within the renewal grace period) FCC-issued commercial radiotelegraph operator license or permit: Element 1(C).

* * * * *

9. Section 97.507 is revised to read as follows:

& 97.507 Preparing an Examination.

(a) Each telegraphy message and each written question set administered to an examinee must be prepared by a VE holding an FCC-issued Amateur Extra Class operator license. A telegraphy message or written question set, however, may also be prepared for the following elements by a VE holding an FCC-issued operator license of the Class indicated:

(1) Element 3(B): Advanced Class operator.

(2) Elements 1(A) and 3(A): Advanced or General Class operator.

(b) Each question set administered to an examinee must utilize questions taken from the applicable question pool.

(c) Each telegraphy message and each written question set administered to an examinee for a Communicator, General, Advanced or Amateur Extra Class operator license must be prepared, or obtained from a supplier, by administering VEs according to instructions from the coordinating VEC.

(d) A telegraphy examination must consist of a message sent in the international Morse code at no less than the prescribed speed for a minimum of 5 minutes. The message must contain each required telegraphy character at least once. No message known to the examinee my be administered in a telegraphy examination. Each 5 letters of the alphabet must be counted as 1 word. Each numeral, punchuation mark and prosign must be counted as 2 letters of the alphabet.

1372. Who lives near 30 MHz?

Newsgroup: rec.ham-radio
Date: 1990-03-01 00:54:17 UTC
From: fnddr@acad3.fai.alaska.edu
Message-ID: <1990Mar1.020823.26931@hayes.fai.alaska.edu>
Source record: 13077

We've had a chronic problem with our riometer (gadget which monitors cosmic background noise near 30 MHz) picking up signals instead of noise when the skip is good. I've monitored the frequencies off and on, and sometimes I can hear some very faint broadcast stations in the 29-30 MHz range. They are generally too faint to hear what is said, but sometimes one is strong enough to identify the language as a slavic variety. Perhaps a Soviet home service? If anyone has any loggings between, say, 29.8-30.2 MHz, I'd be very interested in hearing about it.
Thanks,

Cross-posted to: rec.ham-radio,rec.radio.shortwave

I received a catalog from a mail order firm in Cagona Park in California
called DAK. They are selling a Digital PLL Tuning Shortwave radio having

AM -(530-1630)KHz
SW - (3200-21750)KHz
FM - 87.5-108 MHz

It also has 20 preset memory, clock/alarm/timer. Ext. Antenna jack,
Illuminated LCD display.....All for US$50.00. The price seems too
good to be true. Does anyone have any information on this product
or the company ? There number is 1-800-325-0800.

Any information on this would be appreciated.

Thanks,
Ranjan

> Why is it that the Canadian license was called "digital"
> when it in fact was really a "nocode" license?

It was called digital because there's a big essay format component on the exam that is 100% concerned with digital issues (queueing theory, information theory, packet and networking ideas, modulation & encoding, & c.) How come you're so concerned to make sure everyone calls it a "no code" ticket? It doesn't have anything about disco dancing either - shouldn't it be a "no-disco" ticket?

What I mean here is that you seem to be more preoccupied with what the class is _not_ than with what it _is_. Classification by negatives is not, IMHO, a very useful activity. You wrote a CW exam, which is honourable, and you can run packet if you like, which I find strange.

I wrote a packet exam, a regs-and-operations exam, and an electronics exam. A general writes the same regs-and-operations, a less rigourous electronics exam, and a CW exam. I think the setup in either case is good in that it wants to see demonstrable proficiency in the mode(s) that the ham wants to run.

Do you see me going around calling generals "no-packet" and making out that they're some lower form of life? Why are you so eager to point out my (admitted - CW is a useful mode and an art) shortcomings? Jealous, maybe?

> How much effort was made by already licensed hams to get new hams to join
> the hobby?

The already-licensed hams _I_ knew encouraged me to go for Digital.

I need help identifying a couple of transistors. They are marked 'GM0290A',
have a Texas Instruments logo, and 4 connecting leads. They are in the
front-end of a VHF radio - they look like RF amplifiers to me.
No part-numbers like these appear in my TI catalog.
What are they? PNP, NPN, Silicon, Germanium? In view of the age of the
equipment (early 1960's) i would guess Germanium PNP but i want to be sure...

How about a SPELLING test?

If you had any discipline at all you would learn to spell better.

And if you had, it would not have changed your attitude, but rather you
would have just given them all the standard lectures on discipline.

I have my own kind of discipline. It works like this: if it's something
I know I won't want to do or finish, I won't start it in the first place.
I guess I broke discipline when I took the Novice code test.

I hate to say it, but that's probably true. The original idea behind testing at all was to make sure you didn't cause harm by interfering with other services. Additional testing for higher grades was instituted because improperly adjusted 'phone' transmitters could cause havoc. Later the FCC decided that was obsolete thinking. Later, the ARRL that came up with the quaint notion that a 'classless' society was 'unamerican' and persuaded the FCC to reinstitute "incentive licensing'.

Today, with modern radios, the only testing truly necessary from the administrative point of view is on rules and regulations and perhaps some operating procedures. Anything else is more for social rather than technical reasons. The remaining question is which social benefits you consider important for best results and to achieve them. Obviously, the present junk on many ham bands shows the present system isn't working as intended.

"Robert Carpenter, you asked for it..."

PR Docket No. 90-55

In the Matter of

Amendment of Part 97 of the RM-6984 RM-6985
Commission's Rules Concerning RM-6986 RM-6987
the Establishment of a Codeless RM-6088 RM-6989
Class of Amateur Operator License. RM-6990 RM-6991
RM-6992 RM-6993
RM-6994 RM-6995

NOTICE OF PROPOSED RULE MAKING

Adopted: February 8,1990; Released: February 16, 1990

By the Commission:

I. INTRODUCTION
1. In this Notice of Proposed Rule Making (Notice), we propose to establish a new class of amateur operator license that would not require the applicant to prove that he or she can send and receive manual Morse code telegraphy messages. This proceeding was initiated by twelve petitions for rule making filed on matters generally relating to the amateur operator license class structure, requirements, and privileges./1

II. BACKGROUND
2. The amateur service exists for the purpose of self-training, intercommunication and technical investigations carried out by duly authorized persons interested in radio technique solely with a personal aim and without pecuniary interest./2 Article 32 of the international Radio Regulations requires, among other things, that each person seeking a license to operate the apparatus of an amateur station prove that he or she has the ability to send correctly by hand and to receive correctly by ear text in Morse code signals. Although this requirement may be waived for an operator of an amateur station transmitting only on frequencies above 30 MHz/3, each of the five classes of operator licenses issued by the Commission/4 requires the applicant to pass an examination in the international Morse code./5
3. Over the years the Commission has received requests from persons who want to pursue the purposes of the

amateur service, but who argue that Morse code telegraphy is an unnecessary barrier to obtaining a license. Historically, however, the amateur community has strongly supported a telegraphy skill requirement for every class of amateur operator license. In a 1974 rule making proceeding,/6 and again in a 1983 rule making proceeding,/7 amateur licensees showed nearly unanimous opposition to proposals for a no-code license.

4. In the 1974 rule making proceeding, we proposed an overall restructuring of the classes of amateur operator license. Included in those proposals was the establishment of a codeless class of license. Although it resulted in several improvements to the license structure, the proceeding was terminated without action on the codeless license class./8 It was during the pendency of this proceeding that the computer-aided license application processing system currently in use was developed. The capability for processing a sixth class of license, therefore, was incorporated into the design for the system. In the 1983 rule making proceeding, the Commission again sought ways to provide a class of codeless license. One proposal was the deletion of the slow speed telegraphy examination requirement for the Technician Class license./9 The alternative proposal was a new operator license class patterned after a Canadian codeless class of amateur license, and having very difficult written examination requirements. This proceeding was also strongly opposed by the amateur community and was terminated without action./10 The above-listed petitions initiating this proceeding, however, indicate that the sentiment in the amateur community now appears to favor a code less license class. The ARRL, for example, states that it now supports a codeless license as being "beneficial to the future, short and long term of the Amateur Service"/11 The issue of a codeless class of amateur operator license, therefore, should be considered in light of current circumstances in the amateur service.

III. DISCUSSION

5. A significant segment of the amateur community has a new view of the role of telegraphy in the future of the service. David Stall states that "numerous recent surveys have demonstrated that the concept of a no-code license is rapidly attracting a wide base of support within the amateur community."/12 The ARRL states that its recent studies show:

> Encouraged by changes in the FCC rules, packet radio and other digital modes have become extremely popular and have led to amateur radio becoming increasingly attractive to computer-literate individuals who possess the ability to contribute

significantly to the service, but who fail to perceive the relevance of manual Morse code. Many amateurs welcome the idea of providing a gateway to these individuals. The possibility now exists to dispassionately evaluate a codeless amateur license on its own merits. It is this factor that accounts for what the League perceives as a significant shift in attitudes among amateurs toward a codeless amateur license./13

6. The SCATG states that the time is right for a codeless class of license:

Morse code operations were once the only way to make radio communications possible. It is now just a facet of an entire spectrum of possible methods of radio communications. It is no longer in keeping with the basis and purpose of the Amateur Radio service to stress one facet of radio communications over all others. Knowledge of code doesn't eliminate rules violations or uncourteous operations./14

7. Burt Fisher, a teacher of electronics at a regional high school, states "the public need would best be served

Message-ID: <13724.25ED2D2E@stjhmc.fidonet.org>
Source record: 13090

if there were a door into amateur radio that had a limited code requirement. Once in the door, these youngsters would be tempted to the rest of the world (and technology) of amateur radio. The public would be served as the base of potential scientists and technicians would be enhanced...." He believes that a written examination could be used to ascertain that an entry level license applicant has knowledge of telegraphy./15 Michael Trahos believes that it is essential to have a codeless beginner license so that the amateur service will not stagnate or experience a decrease in the number of licensees. He believes that if a codeless license is not established, the number of licensed amateur operators will decrease, with a consequent increasing re-allocation of amateur service spectrum by the Commission to the land mobile services./16

8. John McCord believes a codeless class of license would "attract many young minds to the hobby of amateur radio...."/17 Dennis and Linda Welch find the issue of a codeless class of license contentious and defended mostly by the older amateurs and championed by the very population needed for expansion./18 Bill Welsh, who has a personal preference for code operation, foresees "that its years as a realistic amateur radio licensing requirement are coming to an end."/19 James E. Taylor states that telegraphy is no longer necessary and that the number of amateur operators must be drastically increased in order to "continue to justify our existence."/20 Clement Bourgeois, however, disagrees. He states that a knowledge of telegraphy by every amateur operator is essential. He does believe, however, that the high speed telegraphy examination/21 should be reduced to 15 words-per-minute or less. Larry Ballentine suggests that telegraphy examinations only require the examinee to recognize telegraphy characters, rather than to send and receive text at specific rates of speed./23

9. Operator license structure. The petitions espouse various views on the structure of the license ladder. The general consensus, however, is that a codeless class of license should be the beginning step on the ladder. The ARRL believes that there is nothing antiquated or irrelevant about the Morse code, or its use in the Amateur Radio Service, but that this is a "matter that some individuals must learn for themselves, in order to appreciate that relevance."/24 Most of the petitions favor a struc-

ture that avoids any negative effect upon any current licensee. One approach would add a sixth class of operator license. David Stall recommends this approach, with the sixth class modeled after the Novice Class, without the telegraphy requirement. He believes that a codeless license should provide "a no-code entry into amateur radio without disrupting the existing classes, privileges, or incentives."/25 Burt Fisher also favors the sixth class approach,/26 as does ARRL, with the codeless class positioned in the license structure so that there is an upward path "to the present Technician license by way of a five words per minute Morse code examination...."/27

10. Another approach taken in the petitions is to preserve the current five class structure by conversion of the Novice Class to a codeless class. John McCord, for example, recommends elimination of the telegraphy requirement for the Novice license./28 In addition to conversion of the Novice Class, Dennis and Linda Welch also suggest a merger of the Technician and General Classes./29 The SCATG recommends that the Novice Class be gradually replaced by a non-renewable codeless class that would "minimally disrupt the existing license structure to avoid disenfranchising current licensees. ... [t]he new license should avoid isolating the newcomer from the mainstream of amateur radio operators and operations while maintaining the incentive to upgrade and providing attractive privileges for the newcomer...."/30

11. Other petitions suggest major revisions to the license class structure. James Taylor states that prospective amateur operators "are put off by the present complex, layered structure of our hobby...." He suggests one all-purpose operator class./31 Alan Horowitz suggests "a no-code ham license, similar to Canada's license structure."/32 Michael Trahos, however, states that "[t]he Canadian no-code experience has clearly shown that creation of a no-code license class with examination requirements greater than that of the lowest available code license class fails to promote interest in, or insignificantly increases, the number of licensed amateur radio operators."/33 He suggests, instead, two new codeless classes./34 Bill Welsh believes that emission mode privileges should be earned "by passing written and on-the-air operating tests that are directly related to the desired additional emission/mode privilege being sought."/35 He suggests that all frequency segments now offered as incentives be eliminated./36

12. Operator privileges. The petitions generally concur that, as a minimum, a station control operator holding a codeless class of license be authorized all emission privileges on the 1.25 meter (m) and shorter wavelength bands. For the longer wavelength bands, however, there

are several views, starting with James Taylor's recommendation that all possible privileges be authorized to the codeless class./37 Michael Trahos and SCATG recommend including the 6 m and 2 m bands./38 Burt Fisher recommends authorizing the 52-54 MHz segment in the 6 m band. He also recommends including the 2 m band, but excluding emission F3E on that band./39 The ARRL recommends excluding operation on both the 6 m and 2 m bands./40 Dennis and Linda Welch,/41 David Stall,/42 and John McCord make recommendations similar to those of the ARRL. John McCord, however, suggests including digital type emission privileges on the 6 m and 2 m bands./43

13. The petitions recommend that the eligibility for the codeless class of license, like all amateur operator licenses, require the passing of a written examination. The ARRL states that the written examination should reflect the privileges to be earned and require a greater commitment than does the present Technician class written examination. It believes that the lessons learned from codeless license programs in other countries necessitate a significant written examination. The ARRL recommends, therefore, that a written examination for the codeless license be administered under the Volunteer Examiner Coordinator (VEC) system. The ARRL also recommends a 60 question written examination consisting of the current 55 question

written examination for the Technician Class Operator license, augmented by five additional questions related to the specific privileges afforded the codeless licensees. Two of the new questions would be concerned with the application and use of telegraphy and the remainder would be concerned with digital communication techniques./44 The SCATG states that the written examination should consist of 50 questions./45

14. The petitions also suggest names for a new codeless class of license. The SCATG suggests "Apprentice."/46 Burt Fisher suggests "Novice-V."/47 Michael Trahos suggests "Novice-Plus" and "Technician-Plus."/48 David Stall suggests "Limited."/49 The ARRL states that its suggested name "Communicator," although "not exactly reflective of the type of license envisioned in the proposal... is, however, the most descriptive among those alternatives considered."/50

IV. PROPOSAL

15. We believe that the petitions have merit. Further, like the petitioners, we believe that this is a propitious time to propose the establishment of a codeless license, given the advances in electronic communications in the past few years. We propose, therefore, to establish a codeless class of amateur operator license, the Communicator Class. With respect to this proposed operator class, we have established three objectives. Our first objective is to offer an entry level license opportunity to all persons who find the telegraphy requirement a barrier to pursuing the purposes of the amateur service. Our view is best expressed by the statement of the ARRL that "the goal of the codeless amateur license is to bring such licensees into the 'mainstream' of the Amateur Radio Service, and to encourage them to upgrade their license class."/51 Our second objective is to propose a type of license that can be implemented quickly if a decision is made to proceed. Our third objective is to avoid any negative effect upon current licensees, upon the work of the volunteer examiners, or upon the Commission's workload or resources. To preclude any impact on our resources, it is imperative that our existing computer-aided application processing system be utilized "as is."/52 The proposed rule amendments are contained in the attached Appendix.

16. In proposed Sections 97.501 and 97.503(b)1), we

would require that the applicant for a Communicator Class license pass a 60 question written examination, as requested by ARRL. In sum, there would be an expanded entry level examination and corresponding question pool. We concur with ARRL that the written examination for the Communicator Class license should correspond to the privileges for that class of license./53 The new question pool would be comprised of the questions from the two pools currently used in the Novice and Technician license examinations, and new questions as requested by ARRL./54 By incorporating existing questions, over 91 percent of the question pool for a Communicator Class license would already be available and would help facilitate a smooth transition./55

17. Operator license structure. In proposed Section 97.9. we would incorporate the Communicator Class in a simplified license structure containing four ascending steps: Communicator, General, Advanced, and Amateur Extra Classes, Current Technician and Novice Class operator licenses would be grandfathered indefinitely. There would be no new licenses issued for those license classes, but existing licenses could be modified or renewed. This approach would meet the objectives we established in paragraph 15. Dennis and Linda Welch, John McCord, and SCATG suggested preserving the five-step ladder by eliminating the telegraphy examination requirement from the Novice class license. This approach deserves careful consideration by the amateur community because of its simplicity. We did not propose this approach because of its disadvantage of lowering the license qualification standards for the Novice operator class. As such, it may be unacceptable to the hundreds of thousands of amateur operators, including the 85.000 current Novice Class licensees, who qualified for the Novice license by passing a telegraphy examination. The Novice Class has operating privileges below 30 MHz, necessitating the need for a knowledge of telegraphy as described in paragraph 2.

18. For future licensees, the Communicator Class license would be the first step in the license structure instead of the Novice Class. Our premise is that most newcomers to the service, given the choice, would elect to qualify for the Communicator Class license rather than the Novice Class license. There would, therefore, no longer be a need for the Novice Class license. We particularly invite instructors, volunteer examiners (VEs). and VECs to submit comments on the validity of this premise, including factual information on the time and effort that would be required for persons to prepare for the proposed 60 question Communicator Class written examination as compared to the time and effort currently required for

the Novice Class 30 question written examination and telegraphy examination.

19. Because the written examination for the Communicator Class license would be more comprehensive than that of the Technician Class license, the Communicator Class would also serve in the stead of the Technician Class for future licensees. Each step in the proposed four step structure provides recognition that the holder has significantly advanced his or her skills in both the communication and technical phases of the radio art./56 This structure could be rapidly implemented. The present license application processing system and license application form would continue to be used./57

20. Operator privileges. The proposed control operator privileges of the Communicator Class would generally be those suggested by the ARRL. The privileges would include all authorized emission types. The proposed transmitter power standard would be 200 watts peak envelope power. The licensee's station would be eligible for a Group D call sign./58 Stations with Communicator Class control operators would not be permitted to transmit on the 2 m and 6 m bands. In view of ARRL's desire to bring the codeless class into the mainstream of the amateur service,/59 however, we particularly invite comment on the effect of excluding Communicator Class licensees from these two popular bands.

21. The ARRL stated that one premise for its petition

Message-ID: <13726.25ED2D32@stjhmc.fidonet.org>
Source record: 13092

was that an accommodation should be made for codeless class licensees to upgrade their license class. It cited countries that have codeless licenses where the written examination tests the examinee's technical qualifications. The ARRL stated that amateur service societies in countries such as Australia, the Federal Republic of Germany, and Belgium report ongoing telegraphy activities among the codeless class licensees working to upgrade the license class./60 While the proposed Communicator Class privileges include telegraphy on the 1.25 meter and shorter wavelength bands, we recognize that telegraphy operation is more closely associated with the HF bands. The opportunity for newcomers to the amateur service actually to send and receive messages in the Morse code on small segments of the HF 80, 40, 15, and 10 meter bands is provided to the Novice and Technician Classes so that those operators can gain an appreciation of telegraphy and acquire the proficiency needed to pass the telegraphy examination for the General Class operator license. We specifically request comments, therefore, concerning the desirability of including the opportunity for Communicator Class licensees also to experience on-the-air telegraphy operation on the HF bands. In view of our obligation under the provisions of the international Radio Regulations,/61 if it is desired, only domestic communications on the HF bands would be authorized.

22. Under proposed Section 97.301(g), a Communicator Class licensee who passes, or otherwise receives credit for a telegraphy examination, would be authorized the additional privileges of the Technician Class./62 To avoid a license processing burden, however, the documentation of the passing of, or credit for, a telegraphy examination would be evidenced by the Certificate of Successful Completion of Examination (CSCE) issued by the administering VEs,/63 rather than by the issuance of a Technician Operator license. The indicator used by the Communicator Class for identification purposes would be AC./64 Under proposed Section 97.505(a)(1), VEs would be authorized to grant examination credit, evidenced by a CSCE, to a Communicator Class examinee for the slow speed telegraphy examination when the examinee holds a Novice Operator license./65 That combination, Communicator Class license and CSCE, would permit the Communicator Class licensee the same rights and privileges of

the Technician Class operator. The VECs would provide listings, in paper or magnetic form, of the Communicator Class licensees who have been issued the CSCE.

23. Volunteer examiners. The instant proposal contains substantive changes in the amateur operator license examination procedure and the issuance of amateur operator licenses and CSCEs. All operator license examinations would be administered under the VEC system./66 The additional task of administering the Communicator Class license would be offset by the elimination of other tasks, including the discontinuance of the two examiner system for the Novice Class license./67 The coordination and oversight by the VECs provide more credible results than does the two examiner system. In the latter, examination administration errors are more common and cheating is a greater problem than in the VEC system. The task of administering new Technician Operator Class licenses would also be discontinued./68 The Novice and Technician written examinations would no longer be prepared and administered as separate examinations. The VEs and VECs, moreover, could be reimbursed for out-of-pocket costs incurred in connection with all examinations./69

V. CONCLUSION

24. We believe that this proposal would achieve the objectives set forth in paragraph 15 above. We seek comments, therefore, on the proposed revisions to Part 97 to establish a Communicator Class Operator license for the amateur service, as set forth in the attached Appendix.

VI. PROCEDURAL MATTERS

25. For purposes of this non-restricted notice and comment rule making proceeding, members of the public are advised that ex parte presentations are permitted except during the Sunshine Agenda period. See generally 47 C.F.R. 1.1206(a). The Sunshine Agenda period is the period of time which commences with the release of a public notice that a matter has been placed on the Sunshine Agenda and terminates when the Commission (1) releases the text of a decision or order in the matter; (2) issues a public notice stating that the matter has been deleted from the Sunshine Agenda; or (3) issues a public notice stating that the matter has been returned to the staff for further consideration, whichever occurs first. 47 C.F.R. 1.202(f). During the Sunshine Agenda period, no presentations, ex parte or otherwise, are permitted unless specifically requested by Commission or staff for the clarification or adduction of evidence or the resolution of issues in the proceeding. 47 C.F.R. 1.1203.

26. In general, an ex parte presentation is any presenta-

tion directed to the merits or outcome of the proceeding made to decision-making personnel which (1) if written, is not served on the parties to the proceeding, or (2), if oral, is made without advance notice to the parties to the proceeding and without opportunity for them to be present. 47 C.F.R. 1.1202(b). Any person who makes or submits a written ex parte presentation shall provide on the same day it is submitted two copies of same under separate cover to the Commission's Secretary for inclusion in the public record. The presentation (as well as any transmittal letter) must clearly indicate on its face the docket number of the particular proceeding to which it relates and the fact that two copies of it have been submitted to the Secretary, and must be labeled or captioned as an ex parte presentation. 47 C.F.R. 1.1206.
27. Any person who is making an oral ex parte presentation and presents data or arguments not already reflected in that person's written comments, memoranda, or other previous filings in that proceeding shall provide on the day of the oral presentation an original and one copy of a written memorandum to the Secretary (with a copy to the Commissioner or staff member involved) which summarizes the data and arguments. The memorandum (as well as any transmittal letter) must clearly indicate on its face the docket number of the particular proceeding

and the fact that an original and one copy of it have been submitted to the Secretary, and must be labeled or captioned as an ex parte presentation. 47 C.F.R. 1.1206.

28. Authority for issuance of this Notice is contained in Sections 4(i) and 303(l) and (r) of the Communications Act of 1934, as amended, 47 U.S.C. 154(i) and 303(l) and (r). Pursuant to applicable procedures set forth in Sections 1.415 and 1.419 of the Commission's Rules, 47 C.F.R. 1.415 and 1.419, interested parties may file comments on or before August 6, 1990, and reply comments on or before September 7, 1990. All relevant and timely comments will be considered by the Commission before final action is taken in this proceeding. To file formally in this proceeding, participants must file an original and four copies of all comments and reply comments. If participants want each Commissioner to receive a personal copy of their comments, an original and nine copies must be filed. Comments and reply comments must state the proceeding to which they relate (PR Docket Number). They should be sent to the Secretary, Federal Communications Commission, Washington, D.C. 20554. Comments and reply comments will be available for public inspection during regular business hours in the Dockets Reference Room (Room 239) of the Federal Communications Commission, 1919 M Street N.W., Washington, D.C. 20554.

29. In accordance with Section 605 of the Regulatory Flexibility Act of 1980. 5 U.S.C. 605, the Commission certifies that these rules would not, if promulgated, have a significant economic impact on a substantial number of small entities, because these entities may not use an amateur station to transmit any communication the purpose of which is to facilitate the business or commercial affairs of any party. See 47 C.F.R. 97.113(a). Moreover, the proposed rules would not require the use of or significantly enhance the sale of any additional amateur station apparatus.

30. The proposal contained herein has been analyzed with respect to the Paperwork Reduction Act of 1980. 44 U.S.C. 3501 et seq., and found to increase the information collection burden which the Commission imposes on the public. This proposed increase in the information collection burden is subject to approval by the Office of Management and Budget as prescribed by the Act.

31. A copy of this Notice will be forwarded to the Chief Counsel for Advocacy of the Small Business Administration.

FEDERAL COMMUNICATIONS COMMISSION

Donna R. Searcy
Secretary

APPENDIX

Part 97 of Chapter I of Title 47 of the Code of Federal Regulation is proposed to be amended as follows:

1. The authority citation for Part 97 continues to read as follows:

Authority citation: 48 Stat. 1066, 1082, as amended; 47 U.S.C. 303. Interpret or apply 48 Stat. 1064-1068, 1081-1105, as amended; 47 U.S.C. 301-609, unless otherwise noted.

2. Section 97.9 is revised to read as follows:

97.9 Operator license.

(a) The classes of operator licenses are Communicator, General, Advanced, and Amateur Extra. There are also two grandfathered classes of operator licenses, Novice and Technician. An operator license authorizes the holder to be the control operator of a station with the privileges of the operator class specified on the license. The license document or a photocopy thereof must be in the personal possession of the licensee at all times when the person is the control operator of a station.
(b) A person holding a Communicator Class operator license and who holds a CSCE indicating that the person passed element 1(A), 1(B), or 1(C) is authorized to exercise the rights and privileges of the Technician Class for the duration of the license term and renewal thereof.
(c) A person holding a Novice, Technician, Communicator, General, or Advanced Class operator license who has properly filed with the FCC an application for a higher operator class that has not yet been acted upon, and who holds a CSCF indicating that the person passed the necessary examinations within the previous 365 days is authorized to exercise the rights and privileges of the higher operator class.

3. Section 97.17(a) is revised to read as follows:

97.17 Application for new license.

(a) Any qualified person is eligible to apply for an amateur service license. No new Novice or Technician Class operator licenses will be issued.

4. Section 97.119(e) is revised to read as follows:

97.119 Station identification.

(e) When the control operator is using privileges on the basis of holding a CSCE, an indicator must be included after the call sign as follows:

(1) AC for Communicator Class operator;
(2) AG for General Class operator;
(3) AA for Advanced Class operator; or
(4) AE for Amateur Extra Class operator.

5. Section 97.301(a) is revised and a new paragraph (g) is added to read as follows:

--

* * * * *

(g) For a station having a control operator holding a Technician, General, Advanced or Amateur Extra Class operator license:

Wave- length band	ITU Region 1	ITU Region 2	lTU Region 3	Sharing require- ments

See 97.303,
Paragraph:

VHF MHz MHz MHz
6 m --- 50-54 50-54 (a)
2 m 144-146 144-148 144-148 (a)

6. Section 97.501 is revised to read as follows:

97.501 Qualifying for an amateur operator license.

An applicant must successfully pass an examination for the issuance of a new amateur operator license and for each change in operator class. Each applicant for the class of operator license specified below must pass, or otherwise receive examination credit for, the following examination elements.

(a) Amateur Extra Class operator: Element 1(C), and elements 3(A), 3(B), 4(A), and 4(B);
(b) Advanced Class operator: Element 1(B) or 1(C), and elements 3(A), 3(B), and 4(A);
(c) General Class operator: Element 1(B) or 1(C), and elements 3(A), and 3(B);
(d) Communicator Class operator: Element 3(A).

7. Paragraphs (b) and (c) of Section 97.503 are revised to read as follows:

97.503 Element standards.

(b) A written examination must be such as to prove that the examinee possesses the operational and technical qualifications required to perform properly the duties of an amateur service licensee. Each written examination must be comprised of a question set as follows:
(1) Element 3(A): 60 questions concerning the privileges of a Communicator Class operator license. The minimum passing score is 45 questions answered correctly.
(2) Element 3(B): 25 questions concerning the additional privileges of a General Class operator license. The minimum passing score is 19 questions answered correctly.
(3) Element 4(A): 50 questions concerning the additional privileges of an Advanced Class operator license. The minimum passing score is 37 questions answered correctly.
(4) Element 4(B): 40 questions concerning the additional privileges of an Amateur Extra Class operator license. The minimum passing score is 30 questions answered correctly.
(c) The topics and number of questions required in

each question set are listed below for the appropriate
examination element:

Topics Element:
3 3 4 4
(A) (B) (A) (B)

(1) FCC rules for the
amateur radio services 15 4 6 8
(2) Amateur station operating
procedures 7 3 1 4
(3) Radio wave propagation characteristics of
amateur service frequency bands 4 3 2 2
(4) Amateur radio
practices 11 5 4 4
(5) Electrical principles as applied
to amateur station equipment 6 2 10 6
(6) Amateur station equipment circuit

components 4 1 6 4
(7) Practical circuits employed in
amateur station equipment 3 1 10 4
(8) Signals and emissions transmitted
by amateur stations 4 2 6 4
(9) Amateur station antennas and
feed lines 6 4 5 4
8. Section 97.505(a) is revised to read as follows:

97.505 Element credit.

(a) The administering VEs must give credit as specified
below to an examinee holding any of the following docu-
ments:
(1) An unexpired (or within the renewal grace period)
FCC-issued Novice Class operator license: Element 1(A)
and the 30 written questions in Element 3(A) based upon
the material from the written examination passed for the
Novice Class operator license.
(2) An unexpired (or within the renewal grace period)
FCC-issued Communicator Class operator license: Ele-
ment 3(A).
(3) An unexpired (or within the renewal grace period)
FCC-issued Technician Class operator license: Element
3(A).
(4) An unexpired (or within the renewal grace period)
FCC-issued Technician Class operator license issued be-
fore March 21, 1987: Elements 3(A) and 3(B).
(5) An unexpired (or within the renewal grace period)
FCC-issued General Class operator license: Elements
1(B), 3(A), and 3(B).
(6) An unexpired (or within the renewal grace period)
FCC-issued Advanced Class operator license: Elements
3(A), 3(B), and 4(A).
(7) A CSCE: Each element the CSCE indicates the
examinee passed within the previous 365 days.
(8) An unexpired (or expired less than 5 years) FCC-
issued commercial radiotelegraph operator license or per-
mit: Element 1(C).

9. Section 97.507 is revised to read as follows:

97.507 Preparing an examination.

(a) Each telegraphy message and each written question
set administered to an examinee must be prepared by a

VE holding an FCC-issued Amateur Extra Class operator license. A telegraphy message or written question set, however, may also be prepared for the following elements by a VE holding an FCC-issued operator license of the Class indicated:

(1) Element 3(B): Advanced Class operator.
(2) Elements 1(A) and 3(A): Advanced or General Class operator.

(b) Each question set administered to an examinee must utilize questions taken from the applicable question pool.
(c) Each telegraphy message and each written question set administered to an examinee for a Communicator, General, Advanced or Amateur Extra Class operator license must be prepared, or obtained from a supplier, by the administering VEs according to instructions from the coordinating VEC.
(d) A telegraphy examination must consist of a message sent in the international Morse code at no less than the prescribed speed for a minimum of 5 minutes. The message must contain each required telegraphy character at least once. No message known to the examinee may be administered in a telegraphy examination. Each 5 letters of the alphabet must be counted as 1 word. Each numeral, punctuation mark and prosign must be counted as 2 letters of the alphabet.

10. In Section 97.511, the heading and the text are revised to read as follows:

97.511 Operator license examination.

(a) Each session where an examination is administered must be coordinated by a VEC. Each administering VE must be accredited by' the coordinating VEC.
(b) Each examination for a Communicator Class operator license must be administered by 3 administering VEs. each of whom must hold an FCC-issued Amateur Extra or Advanced Class operator license.
(c) Each examination for a General, Advanced or Amateur Extra Class operator license must be administered by 3 administering VEs, each of whom must hold an FCC-issued Amateur Extra Class operator license.
(d) The administering VEs must make a public announcement before administering an examination. The number of candidates at any examination may be limited.
(e) The administering VEs must issue a CSCE to an examinee who scores a passing grade on an examination element.
(f) Within 10 days of the administration of a successful examination, the administering VEs must submit the ap-

plication to the coordinating VEC.

11. Section 97.513 is removed.
12. In Section 97.519, new paragraph (d) is added to read as follows:

97.519 Coordinating examination sessions.

(d) Each coordinating VEC must compile lists of Communicator Class operator licensees who have been issued a CSCE for Element 1(A), 1(B), or 1(C) during each calendar month. The VEC must forward a copy of the list to the Private Radio Bureau, FCC, Washington. DC 20554, by the 10th day following the end of the month.

13. Section 97.527 is amended by revising paragraph (a), removing paragraph (c) and redesignating paragraphs (d) (e) (f) and (g) as (c) (d) (e) and (f) to read as follows:

97.527 Reimbursement for expenses.

(a) VEs and VECs may be reimbursed by examinees for

/49 RM-6994 at 1.
/50 RM-6995 at 17.
/51 RM-6995 at 19.
/52 The sixth license class designation is "Communicator."
/53 A written examination must be designed to demonstrate
that the examinee has the operational and technical qualifica-
tions required to perform properly the duties of an amateur
service licensee in accordance with the privileges authorized by
the class of operator license sought. See 47 U.S.C. 303(l)(1)
and 47 C.F.R. 97.503(b).
/54 Section 97.523, 47 C.F.R. 97.523, requires all VECs to
cooperate in maintaining one question pool for each written
examination element. Each pool must contain at least 10 times
the number of questions required for a single examination.

/55 The current Technician Class question pool consists of 250 questions. There are currently 300 questions in the Novice Class question pool. An additional 50 questions would be added, giving the proposed Communicator Class question pool a total of 600 questions.
/56 See Section 97.1(c). 47 C.F.R. 97.1(c).
/57 Until a revised FCC FORM 610 becomes available, the administering VEs would write in certain information on the current form in the case of an application for a Communicator Operator license. We would furnish information to the VECs for temporary use of the current form, if we decide to proceed with the Communicator Class license.
/58 The computer-aided application processing system selects a new call sign from four basic groupings for assignment to an amateur station. Each call sign is sequentially selected from an alphabetized regional-group list that corresponds to the licensee's class of operator license and mailing address.
/59 RM-6995 at 19.
/60 RM-6995 at 14.
/61 See Radio Regulations, Nos. 2735, and 2736.
/62 The additional privileges include RTTY and data emissions and phone emissions J3E and R3E in a segment of the 10 meter band, and all authorized emissions in the 2 and 6 meter bands, See 97.301 and 97.303.
/63 A Certificate of Successful Completion of Examination is now issued by VEs. See Section 97.511(e), 47 C.F.R. 97.511(e).

Message-ID: <13731.25ED2D3D@stjhmc.fidonet.org>
Source record: 13097

/64 Section 97.119(e) requires that an indicator must be included after the call sign whenever the control operator is using privileges based on holding a CSCE. The indicator AC is proposed for the Communicator Class.
/65 Currently, Section 97.505(a)(2), 47 C.F.R. 97.505(a)(2), requires VEs to give credit to an examinee holding a certificate of successful examination (CSCE) indicating the examination was passed within the previous 365 days. Currently, Section 97.9(b), 47 C.F.R. 97.9(b). authorizes a licensee holding a CSCE indicating that he or she completed the necessary examinations within the previous 365 days to exercise the rights and privileges of the higher operator class. The time limitation that would apply to the use of a CSCE in conjunction with the Communicator Class license authorizing the rights and privileges of the Technician Class would be the duration of the license term and renewal thereof.
/66 Eighteen organizations function as VECs. They accredit VEs, coordinate examination sessions, maintain the question pools, provide instructions to VEs, review and forward completed license application forms to the Commission for processing. Some 50,000 examinations are administered annually under the VEC system.
/67 Some 18,000 to 20,000 persons qualify for a Novice Operator Class license annually. The examinations are administered by two General, Advanced, or Amateur Extra Operator Class licensees selected by the examinee.
/68 Some 10,000 to 15,000 persons qualify for the Technician Operator Class license annually.
/69 Currently, VEs and VEC may only be reimbursed by examinees for expenses incurred in preparing, processing. administering or coordinating an examination for a Technician, General, Advanced, or Amateur Extra Class Operator license. See 47 U.S.C. 154(f)(4)(J) and 47 C.F.R. 97.527.

I called him one day to pick up V31 as a prefix and asked him to repeat his call when he answered since he was kinda weak to me. He refused, said no contact and launched into a big spiel about running "a tight ship" there.

The incident really made me angry. So angry that I sold my TS-820S a few days later. You all can have HF! I have never seen so many rude and crude operators anywhere except on CB. Sorry, fellas, I call 'em as I see 'em.

Forget 10 meters, it's already doomed.

Just my opinion.

My cross refences manual has an ECG/NTE 160 transistor as the equivalent. It is in fact a Germanium PNP RF-IF amp. When I was located in London I use to call RS and they would cross the ECG/NTE part to what ever they had in stock (and sometimes the had the ECG/Philips actual part). Hope this helps.

If you are into building, the RadioKit 20M compact CW transceiver went together rather easily for me. It is based on the article in the May 1987 issue of Ham Radio magazine. The kit includes the cabinet, PC boards, and all of the components and associated hardware. The only part that is not provided is the main VFO dial which RadioKit does not provide, and they inform you of that in their catalog. Since there is not a easy source for this dial (as RadioKit must have also discovered), I made my own.

One main PC board and a smaller PA board are the bulk of the electrical work; you do need to punch out your own front and rear panels. This is not a "Heathkit" in terms of documentation. RadioKit does provide a reprint of the magazine article.

Once together, I did have trouble getting the adjustments correct until I borrowed a spectrum analyzer! I highly recommend obtaining one for the oscillator adjustments, and especially when checking for spurious outputs. The receiver is based on 1496 mixers and 1350 IF amp and is a superhet with a 9 MHz IF. Although I haven't made any measurements on sensitivity, it seems to be quite good.

I am not associated with RadioKit -- I just had a lot of fun building this kit!

1399. Sweeping carrier in the HF bands

Newsgroup: rec.ham-radio
Date: 1990-03-01 19:57:23 UTC
From: charlie@oakhill.UUCP
Message-ID: <3034@radio.oakhill.UUCP>
Source record: 13104
Cross-posted to: rec.ham-radio,rec.radio.shortwave

I have noticed (for some time now) a sweeping carrier
passing through the HF bands. It appears both in the
amateur HF bands and other HF frequencies as well.
It sounds just like someone spotting their VFO
as they spin the VFO dail up or down the band.
At first I assumed this was someone with bad
operating practices but after I noticed it on the
non-ham portions of the HF band I figured it was
some military station with annoying operating
practices.

I now belive that none of the above explanations
apply. I think this sweeping carrier is some sort
of HF propogation sounder. It probably is finding
the MUF and collecting data relating to HF
propogation vs. frequency vs. time. If this is
true how can the FCC license such an obnoixous
thing?

Anybody have any explanations?
Thanks in advance,
C. Thompson WB4HVD

1401. High Voltage RF source/amp

Newsgroup: rec.ham-radio
Date: 1990-03-01 21:24:05 UTC
From: surshkmr@phoenix.Princeton.EDU
Message-ID: <14165@phoenix.Princeton.EDU>
Source record: 13106

This does not have any direct connection to Ham-

As part of my research, I need a high voltage (>300 volts peak to peak) RF (1-50 MHz) source to drive a reactive load that varies with time. The total current that I need for the experiment (and therefore the wattage) is quite small (<1W), but I need an ideal voltage source (the output voltage must remain constant during the experiment ; when the impedance of the load changes).

I was told that an RF transmitter is the only way to go. Are there any commercially available equipment that may do the job?

I have an RF signal generator which produces 30 volts peak to peak into a 50 ohm load . Could I get/build an amp that could produce 300 volts peak to peak from this?

Any suggestions will be greatly appreciated.

Please E-Mail all responses to me , I dont read this newsgroup regularly.

Thanks in Advance!

Suresh

I advise you not to buy Everex products.

I just recently got a Seagate ST-4096 hard disk which was repackaged by Everex. The documentation which came with the disk was incorrect. The software which came with the disk has serious bugs.

Following the documentation written by Everex exactly, I was unable to get the drive to work. After calling the vendor, and talking to their technical support people, I learned that the Everex documentation is wrong. They give faulty information on how to configure the jumpers on disk drives. (The correct information will follow later.) After following the instructions from the vendor tech support people, the disk worked. According to the vendor, Everex admits that their documentation is incorrect, but they won't fix it.
Note: The "drive select" jumpers should be set as follows:
If you have a cable with a twist in it, the DS jumpers on BOTH disks should be set to the second addressable drive. For hard disks, this is drive 2 because addressing starts with DS1; for floppy drives, this is drive 1 because addressing starts with DS0. The drive on the end of the cable with the twist will be the first of the two drives (eg. A:) and the other drive will be the second of the two drives (eg. B:).
If you have a cable without a twist in it, and a single disk drive, the DS jumper should be set to the first addressable drive. For hard disks, this is DS1; for floppy drives this is DS0.

Using the software provided by Everex led to other working systems in my computer becoming non-functional. After calling the vendor, and talking to their technical support people, I learned that Everex admits that their software does not work. The vendor agreed to ship me a copy of Seagate's software. I haven't received it yet, but I expect it to work just fine.
Note: The specific problem I had was: when using the everex device driver "evdisk.sys", my 720k B: drive would not function correctly. You could put in a disk, do a "dir" command, switch disks, do another "dir" command, and see the directory of the first disk. You could "cd" to directories on the first disk which did not exist on the second disk which is actually in the drive. The only (hokey) way out of this problem was to force a drive read fault, to get the "Abort, Retry, or Ignore?" message. This is definitely a bug, and not a feature.
(If the evdisk.sys device driver is not used, then 50M of the 80M disk is wasted under any version of DOS previous to 4.0.)

Rule 1 Don't buy Everex products.

Rule 2 Specify to vendors that you won't accept Everex products.

Rule 3 If you buy something, and it turns out to be an Everex product, see rule 1 and rule 2. Return it.

1404. Radio Shlock DX-440

Newsgroup: rec.ham-radio
Date: 1990-03-02 00:18:01 UTC
From: "4.8": <>;
Message-ID: <9003020018.AA07731@mmlai.LOCAL>
Source record: 13109

Maybe this belongs in rec.radio.sw, but since my site doesn't subscribe, I'm posting here. Please forgive me.

I bought the Radio Shlock DX-440 about 1 year ago and I've been pretty pleased with it up until last weekend. After listening to a clear SW station, I hit scan and it never found another station. FM still works fine and the scan function still searches properly, but no AM/SW stations are being detected, even when programmed directly. This includes SSB and CW stations with BFO in or out. So basically I'm down to an FM receiver of which I already have too many.

I've written to the Shlock to get schematics for the DX-440, but in the mean-time, has anyone else out there experienced this same problem with this radio? Is there a quick fix someone might suggest? Does the radio contain CMOS or any other ESD sensitive parts? FYI, I am an EE and I can handle a soldering iron, so if anyone can point me to the AM detection stage in this thing, I'm willing to give it a shot. The warranty was only 90 days and I didn't opt for the extended version. Could it be something as simple as a single IC chip in a socket? . . . Naah, not if Murphy has anything to say about it!

While I'm at it: the cheapos at RS conveniently plugged the tape out hole on this model to bring the cost <$200. (*&%#@!?ARGH*(#@!) The solder pads are on the board (I've seen them). So what type of jack can be put here to finish RS's job, and where can I buy it? Anyone out there with the Sangean model, etc.? The radios are all the same except for the jack. If I just knew if it was an RCA phono jack and I could find a source for the part . . .

Any help would be greatly appreciated, for whatever my eternal gratitude is worth. E-mail or post (sometimes my e-mail bounces). And, BTW, I recently joined the ranks of amateur extra class. YAY!

In the February 1990 "Monitoring Times", there is an annoucement of a new
service granted by the FCC, Personal Emergency Locator Transmitter Service
(PELTS). It is to use 3 Watt radios in the 220 Mhz band with voice and
homing capablity. The intended use for emergencys for hikers, skiers,
and mountain climbers in wilderness areas. The article was short on details,
so it is unclear whether the equipment will be allowed outside wilderness
areas, and if the frequencys are shared.

One reason for the speed that this was created, was that aircraft ELT
tranmitters were being (ab)used for this application.

Path: vector!poynton

Giovanni Moretti <GMoretti@massey.ac.nz> asks about a log amplifier over 60 dB at 10.7 MHz for a spectrum analyser.

John Whitmore <whit@milton.acs.washington.edu> suggests the classic National Semi appnotes that exploit the logarithmic I/V relationship in a diode. John Wieczorek <johnw@watnext.waterloo.edu> suggests an ICL8048; this part uses the same approach. Both of these approaches are appropriate if the logarithm of a low frequency signal, perhaps up to 10 kHz, is required. However the problem in a spectrum analyser is to get such a wide dynamic range through the IF amplifiers unscathed; IF amplifiers are just not capable of 60 dB, so the log operation must be performed at IF frequencies, not after detection.

As Michael Katzmann <michael@fe2o3.UUCP> suggests, Plessey is the place to look. They have a series of parts starting (SL521, 523, 1521, 1522, 1523) that are specifically designed as logarithmic IF amplifiers (for radar, in fact). In October 1980 these were documented in Radar and Radio Communications IC Handbook, but they're not in the March 1987 Radio Telecoms IC Handbook and I don't have the latest books.

STRANGE HF SIGNALS MAY BE PROPAGATION SOUNDERS

by Bob Parnass, AJ9S

Many scanner and shortwave listeners are curious by nature, and want to know the identity of stations they hear. Pirate broadcast stations have a cult following, as do "spy numbers" and military transmissions.

But, some signals seem to defy explanation. They are neither voice nor data. What are those clicks, tweets, and bursts one hears on the shortwave bands? Perhaps you stumbled upon signals from over the horizon radar, or even an RF induction heating oven. There is another source of these puzzling signals -- your receiver may have intercepted a sounder system used for propagational studies.

A recently released U. S. Navy report gives us a peek at several such radio sweeper systems: HF Maximum Usable Frequency (MUF) Model Uncertainty Assessment, Technical report 1184, by T. N. Roy and D. B. Sailors. June 1987. Naval Ocean Systems Center, San Diego, CA.

Basically, a sounder system consists of a transmitter that emits signals sequentially on several frequencies, and a distant receiver which is programmed to follow the transmitter frequency and measure the signal strength at each channel.

Navy Tactical Sounder System

The Navy has used a system of several shore-based AN/FPT-11 (XN-1) sounder transmitters and shipboard and land based AN/UPR-2 receivers to determine propagation conditions. Known as the Navy Tactical Sounder System (NTSS), the FPT-11 transmits a double, biphase pulse sequence every minute on each of 80 frequencies between 2 and 32 MHz. The 80 frequencies are spaced in 100 kHz increments between 2 and 4 MHz, 200 kHz increments between 4 and 8 MHz, 400 kHz increments between 8 and 16 MHz, and 800 kHz increments between 16 and 32 MHz.

Both receivers and transmitters are synchronized to WWV so the receivers can follow the transmitter frequency sequence.

Granger Model 900 Sounder

The Stanford Research Institute has used a different system to study propagation. Their equipment consists of Granger Associates Model 900 sounders, which cover the 4 to 64 MHz range in four bands of 40 linearly spaced channels each. The Granger sounders are high power, and transmit 30 kW peak pulses of 0.1 ms or 1.0 ms. The scan sequence takes 29 seconds to complete, and is repeated every 20 minutes.

A search of FCC records shows SRI may also be using linear sweepers. SRI was granted license KA2XNH as an experimental contract station to fullfull U.S. Navy contract N00014-83-C-0267. This license permits a 50 watt SRI transmitter to sweep the 2-32 MHz band in 1 Hz increments not more than 3 times per hour at a sweep rate of not less than 5 minutes sweep for the entire band.

Other Systems

Another sounder system consists of a device called a C-3 iosonde, which transmits 0.1 ms pulses and is swept linearly between 2 and 25 MHz.

The BR Communications HF Chirpsounder System takes 5 minutes to sweep between 2 and 30 MHz, and the sweep is repeated every 15 minutes.

Sights and Sounds

It's tough to follow frequency agile signals using only shortwave receiver. Connecting a panoramic display (pana-daptor) makes it easier to identify sounders. One can actu-ally see the sweeper signals moving up the band.

1412. Military Radio Info -- PRC-25 & PRC-70

Newsgroup: rec.ham-radio
Date: 1990-03-02 15:09:00 UTC
From: wmartin@STL-06SIMA.ARMY.MIL
Message-ID: <9003030803.AA24567@ucbvax.Berkeley.EDU>
Source record: 13117

Some days back, there was a posting from a military radio collector, I believe in Europe, who wanted info on the Vietnam-era military radios PRC-25 and PRC-70. I got out my 1981 Jane's Military Communications and herewith the enclosed info. (By the way, I recommend anyone interested in military surplus electronics see if they can get ahold of copies of this publication. It is insanely overpriced when new, like all the Jane's books, at $150 or something idiotic like that. However, remaindered copies show up in mail-order book catalogs now and then. I have bought a couple issues of the Military Communications books for $15 [and I think I saw one being closed out for $10 *after* I paid $15 :-(] from Publishers Central Bureau. The Infantry Weapons back issues tend to go for about $50, and other series are somewhere in-between. "Jane's Shipping Containers" is always very cheap, but I have never figured out who would ever want one! :-) I don't know if there is a European version of PCB; maybe each language-area has their own remaindered-book mail-order house? Any UK readers know of good English-language remaindered- and used-book dealers who would do mail-order with the US at reasonable rates? For the US readers who do not already get 4 catalogs from PCB in the mail each month, here's their address: Publishers Central Bureau, One Champion Ave., Avenel, NJ 07131.)

Here's the radio data:

AN/PRC-25 VHF/FM MANPACK TRANSCEIVER

Platoon and company level communications gear. Developed '59-'60; produced from '61 on. No longer in production as of the 1980 date of this publication. Also came in vehicle-mounted and vehicle/portable versions.

2 bands: 30-52.95 MHz and 53-75.95 MHz

920 channels, 50 kHz separation

2 Whip antennae -- 36" and 129" long (could also be hooked to a ground-plane)

Transmitter power 1 - 1.5 Watts; Weight = 24 lbs. (Wow! You really get a lot of output for lugging around this beast! :-)
Powered by 12.5V battery (type unspecified).
Dimensions: 11" high, 4" wide, 11" long (I would interchange some of these based on the picture. What they call "wide" I would call either "high" or "deep", depending how you sit the thing.)

AN/PRC-70

Developed Aug '64, in production from '71 through the date of the book ('80).

2 - 76 MHz in USB, AM, CW, & FSK
30 - 76 MHz in FM

Transmitter power: SSB = 30W PEP; FM, FSK, CW = 30W; AM = "7.5W Carrier"
(whatever that means)
Weight 20 lb 8 oz (*less* battery case) [No power-requirement info given]

Dimensions: 4" high, 13" wide, 12" long

End of info

Looking thru this brings back memories of trying to DX with an
AN/GRC-106 HF receiver part of the Tx/Rx combo at Nha Trang in '72.
Lousy receiver, as I recall, but maybe it was the antenna... That radio
has individual knobs for tuning each digit and bandscanning was really
tedious! About a three-handed job... For my own radio, I had this
wretched Allied multi-band job and couldn't get much more than the DW
southeast-Asian relay and a few other regional stations. Boy, I wish I
could slip back in time and give me the Sonys I have now then!

Regards, Will

And I advise you not to take the advice of someone who doesn't know which
group to post to.

Yes I know he did follow-up to comp.sys.ibm.pc but that only means that
those who read one of the above groups but not c.s.i.p will only see the
posting of one person without seeing balancing viewpoints from others. If
you are in that category then you should either completely ignore Kenneth's
rantings or else subscribe to c.s.i.p. to read the whole story.

BTW: I have been dealing with Everex for years without having the problems
that Kenneth seems to be having. But then I know how to connect a hard drive.
Maybe Kenneth should stick to buying complete systems.

1414. Kantronics Monobanders

Newsgroup: rec.ham-radio
Date: 1990-03-02 16:17:18 UTC
From: Michael_Edelman%Wayne-MTS@UM.CC.UMICH.EDU
Message-ID: <206193@Wayne-MTS>
Source record: 13119

Brian Shiratsuki mentioned the Kantronics monobanders. As an ex-owner of one, let me make a few comments...

When I saw these they looked like an excellent deal. I tried one out- a 10M model- at a local store and was impressed with the quality and performance. However...

Some months later I bought one from a dealer at a swap at a good price; he had 10 and 15M units for about $220. The unit doesn't come with a noise blanker as standard (!), so I called Kantronics to see if I could order one. Surprise. Kantronics no longer selss these. They sold out their entire lot to various dealers at a close-out price. They have no parts, no manuals and no service info. The outfit they recommended I talk to about service says *they* don't have manuals either. A call back to Kantronics recommended I get get touch with the manufacturer, Tokyo High Power....in Tokyo.

A nice box, but with very poor support. Kantronics is to be lauded for trying to sell it, but roundly castigated for dumping support so quickly. I don't think I'll be doing business with them again soon. I swapped my unit to a friend (with full warnings). He's reasonably happy with it.

1415. FAX tuning questions

Newsgroup: rec.ham-radio
Date: 1990-03-02 17:54:06 UTC
From: greg@cica.cica.indiana.edu
Message-ID: <524@cica.cica.indiana.edu>
Source record: 13120

I'm just getting into shortwave radio an have a question or two...

I'm trying to tune various HF weather FAX stations with varying
degrees of luck. I'm a pilot and the ability to receive up-to-date
weather charts via radio FAX is what got me into SW in the first place.
I have a Yaesu FRG-8800 receiver, going into a Kantronics KAM TNC to a
'puter for storage/display. I've been able to pick up the Norfolk
station on 8.080MHZ and make pictures.

However, I wanted to hook up a 'scope to get the tuning for the KAM spot-on.
Everything I've read says that, using the WEFAX FSK format, I should see
1500HZ for a mark and 2300HZ for a space signal. In between pictures
the transmitter supposedly sends a space signal continuously. If I tune
to 8.078.3MHZ on the FRG-8800 and then adjust the fine tuning for 2300HZ
during the time the transmitter should be sending out a constant space
signal the Kantronics shows a mark signal! Moreover, using said calibration
produces no recognizable picture. If I instead adjust so that the receiver
is putting out 1500HZ during the space transmission, the Kantronics indicates
a space signal is being received (which is what it is supposed to indicate
at 2300HZ) and the ensuing picture is normal.

Is there something I'm missing? Note that I am looking right at the audio
output of the receiver, not the Kantronic's output. Am I actually seeing the
RF carrier and mistaking it for the modem signals? I'm tuning 800HZ below
the published frequencies, USB, btw.

Also, any good public-domain IBM-PC FAX programs?

One program that we(the local Amateur Auxiliary) are putting on for
anyone that is interested is a combo program where we talk about
the Amateur Auxiliary(OO's) and also talk about DF techniques.
The DFing part seems to be a real popular topic. The meetings
seem to run a bit long because there are usually so many questions.

Try contacting your local OO Co-ordinator(get his name from your
ARRL Section Manager) and maybe he can help you find a speaker.

1417. ISDN for linking packet and repeaters

Newsgroup: rec.ham-radio
Date: 1990-03-02 21:11:04 UTC
From: greg@thoreau.nsc.com
Message-ID: <37@thoreau.nsc.com>
Source record: 13122
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

In my area, there are a couple of linked voice repeater systems and several packet networks. The repeaters are linked on VHF and UHF with conventional FM tx/rx. The audio quality is OK if there is only one hop between the originating and receiving repeaters, but gets very poor if the repeaters are at opposite ends of the state.

On packet, the situation is not much better, now using 1200bps dedicated uhf backbone and/or vhf frequencies which are shared with the node users. To communicate with another station a few nodes away, it may take minutes for each packet to reach its destinition.

ISDN (Integrated Services Digital Network), is a new network protocol which aims to handle both voice and data (including X.25). Hardware (and probably software) are or will be available to facilitate an ISDN. It seems to me that ISDN running over a few microwave links would solve both of our linked repeater and packet problems. This is something the Amateur community should be on the leading edge of.

Does anyone know of any Amateur experiments planned or underway involving ISDN? Please reply to me - any replies, I'll summarize to the net.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

* SAREX-2 TESTING CONTINUES *
============================
Last week, the Shuttle Amateur Radio Experiment #2 (SAREX-2) packet radio station underwent extensive testing at the Marshall Space Flight Center in Huntsville, AL according AMSAT Area Coordinator Ed Stluka (W4QAU). This testing was being perfomed in conjuction with the training of STS-35 Payload Specialist Ron Parise (WA4SIR) in the use of the ASTRO-1 experiment which will be primary payload on that shuttle mission. The primary payload, ASTRO-1, will be used to conduct a number of astronomical experiments. During the several days of testing this week, radio amateurs in the Huntsville area were invited to connect to WA4SIR and to receive a QSO number.

This special packet radio station flying on STS-35 on May 9, 1990 will give each radio amateur who connects to WA4SIR a QSO number confirming their contact. When the connecting station sends their QSL card in with this contact number, they will receive back a beautiful QSL card commemorating this HAM IN SPACE shuttle flight. The SAREX-2 packet radio station consist of a Motorola 2M FM H/T with 5 watts ouput, a Heathkit HK-21 TNC-2, and a GRiD laptop computer that has a 40 MB hard disk drive to store the calls of all the stations connecting to WA4SIR during the nine day mission. The specially written software which will be running the SAREX-2 packet station is designed to allow for completely unattended operation and logging of the calls of all connecting stations. It will also prevent duplicate QSO numbers being sent! Although no digipeating will be allowed through SAREX-2, connecting to this packet station will be like any terrestrial packet contact. Just use your TNC along with your 2m tranceiver, and everything else is the same. After you have connected and received your QSL number from WA4SIR, on subsequent orbits you can watch for the SAREX-2 message beacons being sent periodically. The message beacons will contain information about the flight of STS-35 and other interesting items.

Look for more information about the SAREX-2 mission in AMSAT News Service (ANS) bulletins and on AMSAT HF/VHF nets in the next couple of months. For

more specific information about the ASTRO-1 payload, contact the SPACELINK BBS at (205) 895-0028.

=========

MONDAY MARCH 5, 1990

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world on UseNet and Amateur Packet Radio. It is available for UNLIMITED worldwide distribution.

* SHUTTLE NEWS *
================
Phil (KA9Q) heard UHF air-to-ground communications during the launch of shuttle ATLANTIS on mission STS-36. Phil copied a total of four very brief transmissions, all on a frequency of 259.7 MHz. The first transmission was heard at his home in New Jersey at about 02:59:30 AM EST shortly after launch. The last transmission heard at 02:59:30 EST clearly reported "APU shutdown on time".

* UoSAT-OSCAR-15 *
==================
Experiments are under way using a large (150ft) antenna at Stanford (SRI-USA) to attempt to detect very low level signals leaking from the UoSAT-4 on-board uplink receiver local oscillators. If the spacecraft power systems are still functioning, then these signals should always be present since the receivers cannot be switched off. However, these leakage signals are deliberately minimised during the design of the satellite and so they are very weak (-60 dBm = one thousand, millionth of a watt or the equivalent to looking for a single xmas tree light in Australia!). The experiments at Stanford are therefore very demanding: it will only be possible to detect the signals from the background noise using sophisticated off-line FFT signal processing, and a one second error in antenna tracking time may miss the satellite altogether!

de G3YJO

[Story via OSCAR-11]

* BURAN NEWS *
==============
The reusable Soviet space shuttle "BURAN", lying idle since its maiden flight a year ago is to undertake its next mission in 1991. The Soviet Union's chief rocket designer, Yuri Semyonov, told Soviet television recently, that Buran is scheduled to make an unmanned flight in the first half of 1991. A manned mission is expected to follow a year later. Long range plans call for Buran

to dock with the orbiting station Mir, with the possibility of cosmonauts moving between the two to simulate a rescue operation.

* DX CORNER *
=============
SpaceNews is available for unlimited, worldwide distribution. I'd like to personally thank ALL those who take the time to re-distribute SpaceNews on Amateur Packet Radio, telephone BBSs, and other networks. Your efforts are greatly appreciated by many people around the world.

Here is an example of one of the many mail messages I receive from those who read and enjoy receiving SpaceNews in distant places.

From Amateur Packet Radio, the following message was recently received from Germany:

>anyway.

>73 de Jim Grubs, W8GRT

Compared to looking out the scratched, yellow and crazed windows of an
ancient Cessna 150 doing a 45 deg. bank, it is a pretty good , cost effective
solution.

Compared to sitting at sea level (literally!) and wondering where the fish are,
it would be great! Besides, it will work better than you think.

Most *big* fish signs are relatively easy to see... just look for the birds
and follow the food chain. most gamefish kill lots of baitfish, which the
birds scavenge. The other items you look for are:
flotsam, floating turtles (I guess they have to rest also!), and weed lines.
Besides providing cover, most weedlines indicate temperature changes in the
water. but this is not alt.fishing.

1423. need copy of HAM RADIO articles

Newsgroup: rec.ham-radio
Date: 1990-03-03 08:05:56 UTC
From: chris@cups.la.locus.com.la.locus.com
Message-ID: <4661@oolong.la.locus.com>
Source record: 12978

I am looking for a copy of certain articles published in HAM RADIO.
My local public library does not keep back issues older than 3 years
old but I did manage to find a cumulative index and extract the dates:

Jul 83 p53 Two-band receiver, modular, WA3TFS
Sep 84 p8 Comments, WA3TFS
Nov 84 p57 Two-band receiver, extending the modular, WA3TFS
Feb 85 p67 Linear amplifier, HF, solid-state kilowatt, mobile, WA7SPR

If someone would be kind enough to send me a copy of these articles I
would be very grateful, and would of course reimburse any expenses.
I need these articles for reference in a construction project. BTW, if
anyone has built any of these or otherwise has any experience with them
I would be very interested in hearing your comments. Please post them
as I suspect others on rec.ham-radio would be interested also.

Thank you very much. BTW, e-mail to Locus has been having some problems
recently because we are not yet fully registered on the net, so please use
a full path in any replies. If you can route to UCLA or JPL (elroy) there
should be no problem with mail delivery to lcc. The uunet path to lcc may
not be operational for a while.

**** UoSAT-OSCAR-11 BULLETIN - 208 3rd March 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

Data Formats

UO-14 continues to run the FORTH DIARY on the 1802 OBC, using Data formats distributed just after launch. The development, publication and implementation of downlink data formats for OSCARs is a delicate business, especially early in a mission. We do not want to publish data formats if they are likely to change quickly, lest people waste their time implementing software which will later become useless. On the other hand, if we do not publish formats, you cannot listen to the satellites - and that's what they're there for!

In the next month, we will be changing operating regimes on UO-14, as the PACSAT Communications Experiment is brought on line. Once this happens, asynchronous data formats (as used by the DIARY) will give way to synchronous, AX.25 packet formats.

As soon as possible, the PACSAT Communications Experiment on UO-14, and the BBS systems on PACSAT-OSCAR-16 and LUSAT-OSCAR-19 will be brought on line for general use. All three of these satellites will be running the same software, using the same protocols - developed jointly by UoSAT and AMSAT-NA.
NK6K and G0/K8KA have already published a standard for a broadcast

(e.g. bulletins and whole-orbit-data protocol. A final specification should be distributed soon, and early transmissions from the UO-15 PCE will use this protocol. Specification of the message-transfer protocol is well under way.

Thus, the stable state, which we expect to reach sometime this spring, is that UO-14, PO-16 and LO-19 bulletin boards will be accessible with the same groundstation protocol software. Broadcasts from these satellites (e.g. bulletins and whole-orbit data will also come down in a single standard data format. Until we change this state, groundstation software developers are advised to make their programs modular and be ready to revise!

DownlinK Modulation

UO-15 is capable of transmitting either 1200 bits/second AFSK (as used on all previous UoSATs and currently transmited by UO-15), or 9600 bits/second FSK. Ultimately, the PACSAT Commuications Experiment on UO-15 will support only 9600 bps FSK. During the transition from DIARY operations to PCE operations, however, we will also be transmitting AX.25 packets at 1200 bits/second AFSK. Like DOVE, this should be copyable with a standard, unmodified, TNC.

de G0/K8KA.

* UoSAT-OSCAR-15 *

Experiments are under way using a large (150ft) antenna at Stanford (SRI-USA) to attempt to detect very low level signals leaking from the UoSAT-4 on-board uplink receiver local oscillators. If the spacecraft power systems are still functioning, then these signals should always be present since the receivers cannot be switched off. However, these leakage signals are deliberately minimised during the design of the satellite and so they are very weak (-60 dBm = one thousand, millionth of a watt or the equivalent to looking for a single Xmas tree light in Australia!). The experiments at Stanford are therefore very demanding: it will only be possible to extract the signals from the background noise using sophisticated off-line FFT signal processing, and a one second error in antenna tracking time may miss the satellite altogether!

1426. Re: ISDN for linking packet and repeaters

Newsgroup: rec.ham-radio
Date: 1990-03-03 21:16:50 UTC
From: kjh@pollux.usc.edu
Message-ID: <23214@usc.edu>
Source record: 12981
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

In article <37@thoreau.nsc.com> greg@thoreau.nsc.com (Greg Dean) writes:
>ISDN (Integrated Services Digital Network), is a new network protocol
>which aims to handle both voice and data (including X.25).

ISDN is much too litle and far too late (IMHO). I want a few 10Mb/sec
lines coming into my house.

Recently I saw Dr. Robert W. Lucky here at USC. Dr. Lucky writes the
Reflections column in IEEE Spectrum. In his talk, Dr. Lucky mentioned
quite a few interesting things:

1. More than 98% of your telephone bill reflects the cost of
sending you the bill and keeping track of the accounts.
Almost none of your bill goes to maintaining the equipment; the
telephone companies are in the _service_ industry.

2. Over the past few years, the bandwidth capability of the
technology has risen at a phenominal rate, while demand for
bandwidth has remained constant.

Some of Dr. Lucky's suggestions were:

1. Give people HI-FI voice lines.

2. Give people wide bandwidth data lines.

(Note that the cost for both of the above is near zero! See above.)

3. Allow the phone companies to provide cable-tv type
entertainment. (Dr. Lucky suggested that what he wanted was 40
or 50 'channels' all playing the same movie continuously, but
starting about 5 minutes apart. You could start when you
wanted, go to the kitchen or bathroom and then switch 'channels'
to pick up where you left off. This would be quite
convenient.)

ISDN is a good idea, but it is very old technology. We should have had
this years ago. Let's take the idea of ISDN, (which is basically a good
idea), and update it to reflect current technology. I want a few
10Mb/sec lines coming into my house.

1427. HAM Radio/Packet radio Internet protocols with UNIX PC?

Newsgroup: rec.ham-radio
Date: 1990-03-03 23:16:24 UTC
From: lenny@icus.ICUS.COM
Message-ID: <1115@icus.ICUS.COM>
Source record: 12982
Cross-posted to: rec.ham-radio.packet,rec.ham-radio,unix-pc.general

Please forgive me for being very naive on this subject, but it's something that I've been interested in (while perusing rec.ham-radio.*) and I would like to learn a little more about it.

I've recently compiled KA9Q (TCP/IP) package for UNIX on my 3B1/UNIX PC. I've gotten it configured so I can run SLIP between my two 3B1's over a serial connection. Why you may ask would I want to do this with my STARLAN connection, the answer that I just wanted to learn, and with two local machines, it's easiest. I'm still having problems getting the "telnet" to work properly, I think it has to do with how I start the "telunix" and the gettys on the pty's (if someone might have a clue, I'd appreciate any pointers).

Well onto my questions, please E-MAIL me I will *summarize* this ...

How does one get into HAM-RADIO and interfacing it with computers so I could conceivably connect up to the .AMPR.ORG domain and have a TCP/IP connection for TELNET's and FTP's?

What hardware does one need?

The cost involved?

How do I go about getting an FCC license (what's involved education wise)?

Does one transmit modem tones (eg. Telebit Trailblazer PEP tones) over a particular frequency? How do you interface the modem to the ham-radio equipment?

What range in miles does the transmitting and receiving get done? How big is the .AMPR.ORG network? And what computer hardware/ham-radio hardware do they generally use?

Thanks in advance for any insight.

-Lenny

> amateur HF bands and other HF frequencies as well.

It sounds very much like one of the Air Force Communications Command's
propagation sounders. The FCC doesn't have diddly to say about it.

copied from packet:
MSG#7 03/03/90 23:33:47 FROM KD6TH TO WA2ISE
F:145.07

Subject: - files\FT301.MOD

FILE OF INFORMATION ON FT301 MODIFICATIONS

DISPLAY LED'S:

THESE RUN HOT AND OFTEN BURN OUT SEGMENTS. CURE IS TO REDUCE OPERATING
VOLTAGE WHICH TYPICALLY RUNS >5V. FROM VOLTAGE REGULATOR Q2 ON THE MAIN
CHASSIS. A 1N400 DIODE IN SERIES WITH THE OUTPUT OF Q2 DROPS NEARLY A
VOLT FROM THE SUPPLY VOLTAGE. IF THE DISPLAYS STILL WORK OK, THEY WILL
RUN COOL. (PREVIOUSLY, OTHERS HAVE REMOVED RED PLASTIC LENS FOR BETTER
VENTILLATION, OR HAVE EVEN DRILLED HOLES THRU TOP OF RIG.)

SPEECH PROC:

OFTEN FT301'S HEARD ON THE AIR HAVE HAD DISTORTED AUDIO. A SINGLE I.C.
CONTAINS ALL THE MIC AMPLIFICATION AND ALSO DRIVES THE RING MODULATOR
IN THE SSB TRANSMIT PATH. THIS AMP IS DRIVEN TO HORRIBLE DISTORTION IF
THE STOCK (HANDHELD) MIC IS USED AT FULL CLOCKWISE MIC GAIN SETTING.
THIS IS THE WRONG PLACE TO HAVE CLIPPING OCCUR. ALSO RESPONSE OF AMP
IS FAR TO "GENEROUS." SUGGEST LIMITING LOW END RESPONSE WITH SERIES 2.
UF CAP (MUST BE MYLAR OR NON-POLAR) AT MICROPHONE CONNECTOR. HAVE
IGNORED THE FACT THAT THE HI END RESPONSE OF THAT AMP GOES WELL BEYOND
50 KHZ. R.F. CLIPPING IN MY FT301 WAS ACTUALLY ONLY ABOUT 6Db. DUE TO THE LACK
OF RF GAIN IN THE CLIPPER STAGES. THIS CURE FOR LOW GAIN WAS MOST
EFFECTIVE: AN EXTRA STAGE OF GAIN IS AVAILABLE FOR THE TAKING ON THE
"NB UNIT" CARD. (Q201 IS NORMALLY USED ONLY WITH THE PROCESSER OFF AS
AN ALTERNATE RF PATH) RIG Q201 IN SERIES Q202, AND KEEP BOTH STAGES
POWERED UP REGARDLESS OF POSITION OF "RF PROC" SWITCH. WITH THE EXTRA
STAGE, IT IS EASILY POSSIBLE TO KEEP THE RING MODULATOR IN THE LINEAR
REGION AND STILL DEVELOP 15 TO 20 Db. OF RF CLIPPING.
TO IMPLEMENT THIS CHANGE: JUMPER PINS 10 & 11 ON THE N.B. CARD
SUPPLIES VOLTAGE). OPEN 1 K R205 AT WIPER TO VR201, LET IT HANG.
OPEN 0.01 C204 AT TRANSFORMER, AND JUMPER TO WIPER OF R205 WITH SHORT
LEAD (UNSHIELDED SEEMS OK). RUN VR201 AT NO MORE THAN ABOUT 3/4 GAIN.
WITH HIGH LEVELS OF RF CLIPPING, IT IS IMPORTANT THAT THE AUDIO BE
RATHER LACKING IN BASS TO AVOID A MUDDY SOUND. PREEMPHASIS ACCROSS THE
FULL AUDIO BANDPASS SOUNDS PRETTY BAD, SO I WOULD UP WITH A .1 CAP IN
SERIES WITH THE WIPER ON THE MIKE GAIN CONTROL AND FINALLY SHUNTED THAT
CAP WITH ABOUT 1000 OHMS (ADJUST THAT VALUE OF RESISTANCE TO GIVE GOOD
ARTICULATION AND STILL BE SEMI-PLEASANT.

I have dealt with Dak over several years, with satisfaction. They do back up their 30 day trial period with full refund (I even got return UPS charges). No complaints with them; but no info on this particular item. Try it and return it if unsatisfactory!

From: crisp@mips.COM
Message-ID: <36661@mips.mips.COM>
Source record: 12988

Does anyone out there know of modifications that can be made to the FRG9600
to increase it's scanning speed? I feel like 7-8 seconds/frequency is too slow
for my needs.
thanks

I'd like that too! However, don't set your expectation too high. It will be 10-20 years perhaps before this is commonly available from your local telco for the majority of subscribers at rates similiar to what you pay now.

Why? Well, the rate you pay doesn't reflect much to pay for equipment because the phone company spreads that cost over many people and many years.

Also, if you look at the actual data rate from each subscriber, it's very low compared to the 10Mbps your asking for. Worse, it's not the copper in the ground/pole limiting the bandwidht, it's the switch in the central office. It's sized to handle 10-20 of its subscribers off-hook at the same time. Massive upgrades and new technology will be required to support the total aggragate data rate indicated by your simple request. Bell is working on it (ATM networks), newer switching technology, but it's not as easy as it may first appear.

BTW, ISDN is really only an interface spec. ISDN doesn't help at all in terms of moving the data!

Our local paper has unnamed sources stating that the payload
of the Atlantis flight was a sophisticated spy satellite which
would take pictures of areas of the Soviet Union never before
photographed by satellite. Make your own conclusion.

1438. Re: ACC's RC-850 repeater

Newsgroup: rec.ham-radio
Date: 1990-03-05 00:32:00 UTC
From: graham.newton@canremote.uucp
Message-ID: <90030913431015@masnet.uucp>
Source record: 12993

I would be really interested to hear what "bugs" you have found in the RC850 firmware. I bought one of the earliest RC850's for VE3TRO here in Toronto Canada (I think it was less than the 10th unit ACC made).
The equipment has performed well over the years, and we have followed the upgrade path all the way. We are about to install the computer control board and the DVR. (I intstalled the DVR in a Montreal repeater almost two years ago and had good success with it.)
We used an Icom IC22U for a 2 meter remote base on a two meter repeater, using a pair of switched notch cavities to kill the output frequency on the remote base receiver.
We would have liked to see a provision to lock out a number of frequencies on the remote base, since some bright light discovered he could dial up the output frequency and lock up the whole effort!
Generally, I found ACC very co-operative and helpful, and they certainly make probably the best repeater controller available.

Message-ID: <9003050805.AA15831@ucbvax.Berkeley.EDU>
Source record: 12994

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

1440. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1990-03-05 02:42:19 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9003050806.AA15869@ucbvax.Berkeley.EDU>
Source record: 12995

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

1441. icom handheld receiver - brief review

Newsgroup: rec.ham-radio
Date: 1990-03-05 08:03:43 UTC
From: kawai@csli.Stanford.EDU
Message-ID: <12537@csli.Stanford.EDU>
Source record: 12996

I heard a brief review on the new Icom handheld receiver, the IC-R1.
I assume you know what it is (at least the catalog specs); here are
a few remarks. All info hearsay from JA land.

* No frequency up-down key. Must press "enter" every time.
Frequency dial seems okay.
* "Rubber duckie" antenna tuned to popular ham band frequencies,
namely 140, 440, and 1300. Poor sensitivity on other bands.
* Suffers from intermod and poor image rejection when you hook
up other antennas.
* Selling very well (sold out in many stores), but probably ought
to wait until an improved model comes along.

1442. DUAL BANDER RIGS AS REPEATERS ???

Newsgroup: rec.ham-radio
Date: 1990-03-05 09:20:00 UTC
From: RHAREL%FAB8@SC.INTEL.COM
Message-ID: <9003060801.AA06942@ucbvax.Berkeley.EDU>
Source record: 12997

CAN SOMEONE PLEASE LET ME KNOW WHAT MOBILE RIGS ON THE MARKET
TODAY CAN OPERATE AS A CROSS-BAND REPEATER ?
I HAD AN ICOM 3210A AND RECENTLY SOLD IT BECAUSE I FOUND NO WAY FOR
IT TO OPERATE AS A CROSSBAND REPEATER USING THE OFFSET. IN OTHER
WORDS , IT ONLY OPERATED FROM ONE SIMPLEX FREQ. TO ANOTHER SIMPLEX
FREQ. THUS , THERE WAS NO WAY THAT I WAS ABLE TO GO IN ON UHF
AND COMEOUT ON VHF WITH THE 600 KHZ OFFSET.
ANY COMMENTS ABOUT USEOF DUAL-BANDERS, FEATURES ETC. WOULD BE APPRECIATED.

PLEASE USE THE RETURN MAILING ADDRESS LISTED WITH THIS MESSAGE AND NOT
THE GENERAL INFO-HAMS ADDRESS FOR COMMENTING.

Message-ID: <23252@usc.edu>
Source record: 12998

In article <1990Mar4.204752.11276@tandem.com> kevinr@tandem (Kevin J. Rowett) writes:
>BTW, ISDN is really only an interface spec. ISDN doesn't help at all
>in terms of moving the data!

I know ISDN is only an interface spec. The reason why I posted, (and
the only thing that makes it relevant for amateur radio use and this
newsgroup), is that I feel that the bandwidth that ISDN calls for is not
enough. Since equipment will have to be upgraded, and the price
difference for "doing it right the first time" is not that much higher,
I am suggesting that ISDN not be implemented; instead a new spec should
be designed and implemented.

ISDN is too little and too late IMHO.

1444. Re: FCC Petitions

Newsgroup: rec.ham-radio
Date: 1990-03-05 12:12:11 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500432@ux1.cso.uiuc.edu>
Source record: 12999

> How can I find out the status of a FCC Petition, specifically,
> RM 2493? What, if any, is the advantage to responding to a
> petition with an original and 5 copies? Thanks,

Since all matters going to the FCC for action are legal matters, certain procedures need to be followed. In particular, if you are commenting about something said by someone in particular, you MUST "serve" a copy of what you say to them as well. When you make comments about a petition itself, or when you make reply-comments about anyone's comments, you need to send them a copy. The FCC rules (Part 1) spell out exactly what you must do.

Since an NPRM is made by the FCC staff themselves, comments about the NPRM are in fact getting to the staff, so you don't have to serve a copy on them.

Don't file reply-comments unless you know what you are doing. If you don't, might I suggest learning.

> Amateur bands.
>
> ADVANCED As above, plus use of homebrew transmitting
> equipment, maximum legal power, and the
> right to own (?) and operate repeaters and
> remote base stations.

So apparently there are THREE varieties of ADVANCED:

ADVANCED As BASIC, plus use of homebrew transmitting
equipment, maximum legal power, and the
right to own (?) and operate repeaters and
remote base stations on VHF/UHF only.

ADVANCED+5WPM As BASIC+5WPM, plus use of homebrew transmitting
equipment, maximum legal power, and the
right to own (?) and operate repeaters and
remote base stations on VHF/UHF plus limited HF
frequency privileges.

ADVANCED+12WPM As BASIC+12WPM, plus use of homebrew transmitting
equipment, maximum legal power, and the
right to own (?) and operate repeaters and
remote base stations on VHF/UHF plus full HF
frequency privileges.

It almost makes sense even here south of the border in the USA.

> practices.

I've heard this many times myself. One time I heard it running across the
20 meter band DOWNWARD and I decided to CHASE IT. It was moving about 20
khz per second, and just suddenly switched off somewhere around 12.7 Mhz.

> I now belive that none of the above explanations

1448. Increasing CW speed

Newsgroup: rec.ham-radio
Date: 1990-03-05 15:29:18 UTC
From: pswecker@med.unc.edu
Message-ID: <9003051529.AA05504@pelham.med.unc.edu>
Source record: 13003

Well, I finally passed my 5wpm, and am going to take the novice and
tech. tests (and maybe the general) tonight!
I'm continuing to work on my code speed towards the magic 13wpm, but
I'd like to get people's opinions on how best to do it. I'm using the
SuperMorse program on an IBM-PC (it's great), but I'm not sure of the best way
to proceed. Some people suggest that I start building up from 5 to 7 to 10 to
13, while others seem to suggest starting right away at 13 (or even 20!).
While different methods propbaly work for differnt people, I'm curious
to see how most of you went about it.
Thanks!

==

I used the two RCA jacks on the back of the 440. I wired the PTT from pin 13 of the din to the spare RCA. It works ok. I couldn't find a source for 13pin din plugs. I never leave the mic in the radio because I don't like HF phone. No problems with packet or rtty with this setup. I use the mic level control to determin output. It varies a bit from phone, but not alot. I prefer having manual control with the 440.

FT-4700 Frequency expanding modification.
Following example shows programming for 138-174Mhz, and 420-460Mhz.

1. Remove front panel.

2. Locate jumper spots 1,2,5,9,10,13 and short them with solder carefully.
(Other jumper spots must remain as current on the control unit.)

3. Turn power on, and set the display for the lower edge of UHF band
(420.000),u sing up/down buttons, and dial. Then press D/MR button.

4. Set the display to 460.000 and press D/MR. The display shows
47.75(if frequen cy of uhf). Press D/MR, and then uhf coverage is
programmed.

5. Set the display freq. to 138.000 and press D/MR. Then set to
174.000 and pres s D/MR again. the display now shows the VHF if req.
at 17.3. Press D/MR again. Now both band coverages are programmed.

6. After this modification the repeater shift is set to 000mhz, so
it must be set using the F and RPT buttons on both bands. Refer to
page 27 of manual for details.

7. Remember that transmiting outside the amateur bands is prohibited
unless you have a special licence.

Source record: 13007

I note comments from N8DGN and others about ISDN data rates. There ARE
higher rates than 64 kb/s, but probably not to the home. Also I'm being
pulled into something called Broadband-ISDN (B-ISDN), which is more or
less real depending on whom you believe. The goal is 50 megabits per second
at an absolute minimum, and some feel that 600 Mb/s is the minimum that is
interesting. Don't hold your breath for rapid availability in the US.
I'll know a lot more about current state in a couple of weeks when I get
back from the tech meetings in Dallas.

1458. External ant on walkman?

Newsgroup: rec.ham-radio
Date: 1990-03-05 22:43:06 UTC
From: jxh@netcom.UUCP
Message-ID: <8462@netcom.UUCP>
Source record: 13013

Here's a plea to the technical radio people in here:
(By the way, I am studying for my Novice license, code and all, so don't write me off as quickly as usual. Thanks.)
I have one of those little FM-only Sony Walkman devices, and it has problems (no big surprise, there). I want to separate the antenna and audio output functions of the stereo mini jack so I can better receive an FM broadcast station (KITS-FM, San Francisco, 105.300MHz, 13KW @ Mt. San Bruno) from my marginal location (60 miles southeast, in San Jose, in a south-facing office of a Faraday cage). I believe I understand that I need a DC block between an external antenna and the device that will pass >100MHz or so; that's the easy part. Now how do I get the audio part out without weirding-out the front end of the tuner? Oh, yes: and without spending any money. Obviously, I can replace the entire thing for about 15 bucks (although I *still* don't get an antenna input), but I'm doing this for the experience as much as anything. That said, fire away. Am I wasting my time altogether? (With this radio, I mean, not studying code: I can handle that :-)
Should I just go out and *buy* a radio that meets my requirements (low cost FM tuner, stereo, mini-jack audio output, external antenna input)?
Is there one? By all means send me recommendations.

I also have a Sony ICF-2010, but it doesn't have stereo, in this band or any other; SWL doesn't demand it, from a marketing standpoint. *sigh* Is it absolutely out of the question to *modify* it to do stereo? Thought so.

So, here's another chance to set a young'un straight, all you old-timers. Maybe I can return the favor when you blow up both FATs and the partition table on your PC (*I'm* the old timer, over there!). (By the way, the answer to that one is: "When did you last back it up?" Sorry: even magicians have to work with the materials at hand. :-)

Sorry if my .sig comes out twice: this is the first time I've ever posted anything, so I made sure.

>while the rig is transmitting or are the switches failing just by being in
>in the circuit?

Just by being in the circuit.

I soldered in another rotary switch, and I'm able to drive it to at
least 400W on a bad edge of 80 meters without any arcing on the contacts
or capacitors.

I think the switch is just under-engineered, and could be corrected with
a parts mfgr change. There is quite a bit of current on the lowest L
setting, which is where the switch wiper ate it.

From: perry@hpfcdc.HP.COM
Message-ID: <7880130@hpfcdc.HP.COM>
Source record: 13015

I'm in the process of building a legal-limit multi-band HF amplifier. There is an FCC-imposed limit on harmonic content (50 dB ?), but this can be hard to accurately measure without a REAL(tm) spectrum analyzer.

Could a rudimentary "spectrum analyzer" be rigged up using resonant circuits tuned to each harmonic, then sampling the RF voltage ? Or would the non-linearity make this approach unlikely to succeed ?

The approach of having a buddy listen to your harmonics is not a true measurement, since an antenna could radiate harmonics more or less efficiently than the fundamental.

Maybe what I am asking is how to make a spectrum analyzer out of bits of wire and canning jars. Can't be done, right ?

(Michael Harpe) writes:
>
>I called him one day to pick up V31 as a prefix and asked him to repeat his
>call when he answered since he was kinda weak to me. He refused, said no
>contact and launched into a big spiel about running "a tight ship" there.

I've worked V31BB on 10m before. Our QSO was very short, as if he were working a contest, but to the best of my knowledge, there was no contest. As I understand it, Jim (V31BB) worked the ARRL DX contest this past weekend with the V31B contest team.

Speaking of poor contest operators, I had the unpleasent experience of hearing a guy (don't remember the call) this past weekend during the contest. I read the mail for about 5 contacts, during which he never said his call. After the fifth, the guy at our station who was operating at the time stuck in our call sign when he QRZ'd, and he came back to us with "59 kilo". Tom, the guy who was operating, gave him his report and then asked for his call again. He said "If you don't have my call, I don't want to work you. QRZ?" Annoyed at this, Tom gave him about 30 second's worth of "I've seen some really rude operators but you take the cake, pal" sort of ramblings. The thing that really annoyed me is that if the DX guy was such a good operator, he should be giving his call on each contact. The contest rules state that the excange is BOTH station's call signs, sig report, and power or state, depending on which side of the contact you're on. Theoretically, the guy's log contains only about 10% legitimate contacts. Everybody could save time and hence work more contacts by only giving a call sign on one out of every 10 contacts, but some of us play by the rules. To decline a request for a callsign repeat is not only breaking the rules, but just plain rude, obnoxious, and shows what a poor operator you are.

Other contest highlight: we had a neighbor come to the shack complaining of RFI to her VCR. Nothing too unusual about that. However, the thing that made the incident stand out is that she was carrying a loaded rifle, had it pointed at my chest from four feet away, threatened to shoot up the station, and threatened to kill us unless we went off the air. There is a long story involved, but it all boils down to this: we weren't causing the RFI, we continued working the contest, and she got arrested for trespassing, assault with a deadly weapon, and wreckless endangerment. Women...

The moral of this story: Everybody's out for blood during a contest.

I didn't mean the RC airplane part, I meant the NTSC video part. Is broadcast quality really necessary or would something more modest (and cheaper) suffice?

In article <3034@radio.oakhill.UUCP> charlie@oakhill.UUCP (Charlie Thompson) writes:
>I have noticed (for some time now) a sweeping carrier
>passing through the HF bands. It appears both in the
>amateur HF bands and other HF frequencies as well.

>Anybody have any explanations?
>Thanks in advance,

These are the SPREAD SPECTRUM communication signals. There are
usually two modulating signals. One is the useful signal which
modulates the carrier (HF) in one of the common method. The frequency
deviation caused by the useful signal (like data, audio, etc) is
very small.

The other modulation is much greater and results in a widely
spread frequency spectrum. It is the format of this modulation
that characterize the communication. There are several advantages
of the spread spectrum. The "spreading" format is unique for each
station, and only the authorized recevers know the format. Therefore
the S.S. is very secure. Secondly, since the energy is so weak (in
everage sense) in a 10 KC window (that of a radio), the signal can
hardly be noticed (unless slow formats are used).

Most US spied use S.S., by the way.

I recently saw a message saying that someone was looking for me on
this newsgroup. Well, here I am. If you can't get mail to me, you
can try calling me voice at (916) 381-4052. Leave a msg on the
machine if no one answers. Sorry it took so long for me to get back
to you, but my "node" (mmsac) was down for a while. But it's back
now! 73.

I heard 'way too many stations doing that this weekend. Whether it's breaking the rules or not, you're sure right that it's rude and inconsiderate. And, I maintain, wasteful to everyone concerned. I'd really like to know whether these stations have a higher dupe ratio because people go ahead and work them without waiting to find out who they are.

>Other contest highlight: we had a neighbor come to the shack complaining
>of RFI to her VCR.
>we continued working the contest, and she got arrested for trespassing,
>assault with a deadly weapon, and wreckless endangerment. Women...

Right. I've certainly never heard of any incidents where male neighbors got overwrought about RFI. Uh huh. :-)

Most of us "no-coders" are sticking to the International regulations
that access to HF requires Morse code.

Can't communicators get their Morse code practice from tapes and on 2 meters?
uh... well maybe 220 Mhz? Maybe the OF's won't go up there and help them.
Too bad.

As part of my preparation for attendance at the Canadian
grand prix this summer, I am once again looking for any
information regarding radio usage at the United States
grand prix motor race taking place in Phoenix this weekend.
If you are in Phoenix this weekend, and have a scanner, please
have a listen, and note the frequencies any of the teams are
heard to be using. It would also be helpfull to know which
teams are scrambling their communications, and which method they
are using (digital, band inversion, etc.) If someone could
relay this message to other related boards, I would appreciate it,
as I only have access to "INFO-HAMS" here. Thanks all 73

Here's something that may help - get a couple of 0.001-0.01 uF capacitors and
try some of the following:
1) attach a long piece of wire to one side of a capacitor, and
connect the other cap lead to one of the 3 leads of the head-
phone jack. One or more of these should provide a noticable
increase in signal strength. If not, try 2) below.

2) Using the other cap along with the one from 1), rig up a small
dipole for use at the freq of your station (you said you were
studying for your novice exam - good practice, huh? :-)) and
connect it across two of the headphone leads until you get
better reception. It may take a few tries.

```
|
|
---------||--> to phone lead
crude dipole-> ---------||--> to phone lead
| ^-----Capacitors
|
```

This'll let the RF in, but keep the audio in/out.
If this doesn't work, please send me E-mail and we'll discuss it.
PS - good luck on your exam! I got my Tech. ticket in Oct and have had a ball.

copied from packet:
From: SV0DR@SV1IW
To: ALL

FT-4700 Frequency expanding modification.
Following example shows programming for 138-174Mhz, and 420-460Mhz.

1. Remove front panel.

2. Locate jumper spots 1,2,5,9,10,13 and short them with solder carefully.
(Other jumper spots must remain as current on the control unit.)

3. Turn power on, and set the display for the lower edge of UHF band
(420.000),u sing up/down buttons, and dial. Then press D/MR button.

4. Set the display to 460.000 and press D/MR. The display shows
47.75(if frequen cy of uhf). Press D/MR, and then uhf coverage is
programmed.

5. Set the display freq. to 138.000 and press D/MR. Then set to
174.000 and pres s D/MR again. the display now shows the VHF if req.
at 17.3. Press D/MR again. Now both band coverages are programmed.

6. After this modification the repeater shift is set to 000mhz, so
it must be set using the F and RPT buttons on both bands. Refer to
page 27 of manual for details.

7. Remember that transmiting outside the amateur bands is prohibited
unless you have a special licence.

> true how can the FCC license such an obnoixous
> thing?

Right you are. This annoying QRM emanates from a device known as a "chirpsounder", manufactured by an outfit called BR Communications (there may be other sources, but I haven't heard of any). The U.S. military (and Canada, amongst other countries) has a fairly extensive network of these things to support their HF links. Their gratuitous use of spectrum assigned to other services is, no doubt, justified on the basis of National Security. Funny thing though... I would have thought that this justification would only apply in times of National Emergency. Oh well. The next time you get jolted out of your chair by that carrier sweeping through your headphones, try and remember that it's all for the cause of peace 'n freedom, etc. :-)

Why not transmit less than 100% of the time? A 555 timer IC driving
PTT would be ideal. It might even fit on an IDer board.

The failure of DX stations to identify is something that really frustrates me. I think people learn to operate by imitating people they hear, and unless we can get them to change, the chances for seeing improved practices are bleak.

I feel that the main reason DX stations don't identify is that they are afraid of big pileups, and they think that giving their callsign out frequently leads to this. What they don't realize, however, is that failure to identify means getting worked over and over by the same "big" stations, each of whom do not have the time to sit and wait for the DX guy to ID.

In other words, if you give you callsign after every QSO, your pileup could actually be smaller, because the guys who have already worked you will simply move on.

>C. Thompson WB4HVD

I have heard a few of these sweepers. They tend to occupy 10 and 20 meters. Often they have nasty notes (raw AC with hum). Certainly some of them are industrial processes. There are two 'Industrial' frequencies around 13.56 and 27.12MHz for these things. They are diathermy machines, RF-heaters, driers, plastic-welding machines etc. Usually a tuned power-oscillator, AC on the anodes seems to be commonplace. Powers in the tens of kilowatts range are not unusual. They are often coupled to the workpiece with lossy unscreened cables, and drift with changing load capacitance. It obviously doesnt take much imagination to see one of these things drifting into the 10 or 20 meter bands....! When you have 10Kw to play with you do not need an efficient antenna. Add in radiation back down the power lines, from the cooling pipes (they often have water-cooled anodes on the TX tubes - how do you put a choke in a water-pipe??) and undoubtedly more than a whiff of the RF gets out. That is what we hear as 'sweepers'.
When the bands are open, these things can cover enormous distances!
Another popular frequency for medical diathermy sets (used for localised heating/cauterising in hospitals) is around 48MHz. These could easily cause QRM to 50MHz.

This is the second CALL FOR VOTES for the creation of a new newsgroup
to provide a forum for the discussion of noncommercial radio
among broadcasters and listeners.

Vote by replying to this article. Votes must be clearly stated
as for or against rec.radio.noncomm as described in this article.
People who have voted so far are listed at the end of this article.
Please check this list if you have already voted.
Votes will be accepted until March 13, 1990.

NAME: rec.radio.noncomm
CHARTER: unmoderated discussion of noncommercial radio.
Some topics to discuss are:
- listener opinion
- noncommercial AM/FM radio of the college, community, and NPR variety
- carrier current and cable based radio
- do trade journals manipulate or aid?
- upcoming conventions such as the Nat'l Assoc. of Broadcasters/BEA
meeting in Atlanta and the Intercollegiate Broadcasters Society in NY
- the newly released "Public Radio in the 1990s" report by The Public
Radio Expansion Task Force
- the FCC and its regulations
- obtaining and managing non-commercial grants
- programming sources

I know what you mean!

As far as DX stations who don't sign their callsign after every contact, it's not so much to avoid generating a big pileup (hey, if I hear a DX station with a pileup and not identifying him or herself, I'll hang around to find out who it is), but to maximize QSO rate. If a station can work 200 stations in an hour by signing the callsign after each QSO, but another station can work 250 by *not* signing the callsign as frequently, who's gonna win?

>ISDN. It seems to me that ISDN running over a few microwave links
>would solve both of our linked repeater and packet problems. This is
>something the Amateur community should be on the leading edge of.

ISDN isn't a protocol. It's a set of services and interfaces. ISDN is what the phone company supplies, implemented using digital (rather than analog) signaling. Most of its components are taken from existing telephony; some are new -- mainly the call setup protocol and the physical link (wireline drivers). It has nothing to do with microwave links or anything else like that; it's what you'll get soon when you call and ask for a phone.

How can hams use it? The same way we use any other telephone wormhole. But then it's not "ham radio" per se. On the other hand, ISDN means that the non-ham BBS/modem crowd will soon have 64 kbps dial-up (the ISDN circuit rate). And they don't even know morse! ;-) Somehow ham radio won't look state of the art anymore. (Hey, it _was_, years ago.)

>lines coming into my house.

See below about "Broadband ISDN".

>Recently I saw Dr. Robert W. Lucky here at USC. Dr. Lucky writes the
>Reflections column in IEEE Spectrum. In his talk, Dr. Lucky mentioned
>quite a few interesting things:

>1. More than 98% of your telephone bill reflects the cost of
> sending you the bill and keeping track of the accounts.
> Almost none of your bill goes to maintaining the equipment; the
> telephone companies are in the _service_ industry.

Either you misquote him or he's full of bat guano. How do you think
they pay to maintain the equipment -- government handouts? Prices and
true cost are out of line (less so than a decade ago) but telephone
companies have lots of real costs, particularly capital (recovered as
depreciation) and labor (guys pulling wires).

>2. Over the past few years, the bandwidth capability of the
> technology has risen at a phenominal rate, while demand for
> bandwidth has remained constant.

Partially true; demand has risen, especially on the data side. But not
as fast as supply. This has of course reduced profit margins...

>Some of Dr. Lucky's suggestions were:

>1. Give people HI-FI voice lines.

ISDN allows the 7 kHz ADPCM to be used over its 64 kbps circuits; that's
better than the usual 3.1 kHz. B-ISDN allows true hi-fi; CD-quality
was demoed in France some years ago.

>2. Give people wide bandwidth data lines.

>(Note that the cost for both of the above is near zero! See above.)

B-ISDN will allow high bandwidth (as in 150 Mbps). It ain't cheap,
though; they have to pull glass to your door. That might not cost a lot
more than copper, but the _installed_ cost of copper averages something
like $1k/house, capitalized.

>3. Allow the phone companies to provide cable-tv type
> entertainment. (Dr. Lucky suggested that what he wanted was 40

> or 50 'channels' all playing the same movie continuously, but
> starting about 5 minutes apart. You could start when you
> wanted, go to the kitchen or bathroom and then switch 'channels'
> to pick up where you left off. This would be quite
> convenient.)

B-ISDN allows dial-up of a video channel (around 135 Mbps). Not that
the CATV crowd is happy about that, but that's show biz!

>ISDN is a good idea, but it is very old technology. We should have had
>this years ago. Let's take the idea of ISDN, (which is basically a good
>idea), and update it to reflect current technology. I want a few
>10Mb/sec lines coming into my house.

Narrowband ISDN is mainly old technology, ordinary digital telephony and
X.25 with some new glue. Broadband ISDN is newer technology, using
all-glass transmission (well, mostly glass) and interface rates in the
150 and 600 Mbps range. It's got a lot of other "novel" features, and
requires some more development before it'll be practical, but you can
expect early deployments within a few years.

N-ISDN is better than analog telephony. Let's appreciate it for that.
Even 64 kbps beats a modem!

Sorry for the bandwidth splatter, E-mail has been bouncing....

Mr. Cook,

Thanks for the E-mail on old-fashioned radio protocol,
I tried to reply but it bounced. My question is this;

I was in Suadi-Arabia about 6 years ago with a Florida
Ham by the name (i think?) of "Ted Cook". We used to ride
motorcycles in the desert while contemplating how to get a CW
rig operational. Could this be you?? If so, how are you doing??
If not, nice to hear from you anyway and what is your REAL mail
path??

>W0QEV.

Well, I see I've not been doing a very good job of 'advertising' the
un-net (Saturdays, 1700 to 1900 Z).... :-)

Well, in any case, I'm still attempting to be on the air every saturday
9sorry, I missed last Saturday tho) from 1700Z to 1900Z (Z==UTC==GMT)
in the general neighborhood of 28.390 and/or 28.410 MHZ for the 'usenet
un-net'. In the past I've tried to stay between those freqs, but sometimes
band is such that I begin moving 10kHz either way off the end...

In any case, it looked like it was time for me to 'remind' everyone
about the un-net. I promise to make a very strong attempt to get on
the air this weekend, lets see how many usenetters we can talk to!
(Then, once your rig is warmed up, you can go to the Club Net mentioned
above... :-))

The station that ID's every time should win, because the other bozo
would only have, say, 25 legitimate contacts. But alas, nobody insists
on proper procedure and things get progressively worse.

I'm worried already.

> What if the new communicator license was non-renewable? Seems to me that
> that would give people and easy entry into Ham Radio, give them on the air
> experience, and give them five years or so to learn the code.

That defeats the purpose. The purpose is NOT to trick people into getting
into ham radio just so hams can get them to learn code, but rather to let
people who never need to learn code to be IN ham radio without having to
bother with learning it at all.

> Heck, you could even let the communicators re-new if they re-passed the
> theory test again.

Sounds fine to me, let's make ALL classes re-newable by exam only, and
while we are at it, let's do it every TWO years. :-)

> Seems to me the Novice used to be two years, non-renewable. Maybe twp
> years was a little short, but I think the idea was right.

The idea of giving someone a short time to upgrade may be OK, but I strongly
object to your idea of not letting there be a CODELESS license that people
can upgrade TO.

I hope non-hams reading these notes don't get the idea that ALL operations on the HF ham bands are rude and crude. 99% of hams are reasonably considerate operators -- it's just that we tend to remember the other 1%.

SUGGESTION: Try CW. There seem to be far fewer loonies on this mode, and the ones that are there seem much less obnoxious. (Something about the difference between voice and tones.)

SB ALL @ ALLUSA $RTDX0203
RTTY DX Notes, 1of3, 3/2/90

RTTY DX Notes for Weekending 2nd March 1990.
Part 1 of 3.
BID: $RTDX0203

Why must everyone have a mailbox or BBS? I know that they come with the
various units that are available on the market these days, but whatever
happened to communication? And why should all the mailboxes be on the
same frequency? The author of these notes had the pleasure (?) of
sitting on a frequency for four and a half hours the other day while
four or five mailboxes listed their bulletins. Oh well, I guess that
while their mailboxes are spitting out this stuff the owners can go out
and play golf or something. It's a pity that people dont talk to each
other these days.

Our thanks this week go to G0ABI, HL9TG, I5FLN,JA1BLV, JG1NBD, OD5NG,
TG9VT, VK2EG, W1DA, W2JGR, W6/G0AZT and the Tri-State DX Association VHF
Packet Cluster (NN2G, NB2P, WB2ZMK and others). Thanks, chaps. At
least some people do communicate.

RTTY DX Notes, 3of3, 3/2/90
RTTY DX Notes for Weekending 2nd March 1990.
Part 3 of 3.
BID: $RTDX0403

BZ4RCC (Chang) wants his cards via Box 1827, Nanjing P.R. China while BY1SK (Meng) says to send his cards to Box 2916 Beijing, P.R. China. It is important when sending cards to the Chinese stations, that the name of the operator be included in the address.

TR8XX cards go to F2CW.

RH0W/RA4LU is via Box 88 Dimitrivograd-12, 433510 USSR.

Cards for EK0AH, KL7/RW3AH are available from Box 899 Moscow, 127018. USSR.

V31HQ will collect his cards from DL1ZP.

While 8Q7DN QSLS via JA4VUQ.

Information of Interest:

The Western Saraha operation is scheduled for commencement on 18th March for one week. The callsign will be S01LYNX and the QSL manager is EA2JG, Areli Exteguren, Las Vegas 91, 01479, Luyando (Alvaua) Spain. It will be an all band, all mode operation. The calls of S02, S03 and S04 may also appear.

Martti, OH2BH is still on schedule for Aves Island (YV0) around mid March.

Lord Howe Island will commence operation March 28th. It is still not known if there will be any RTTY operation.

ZS9A will be on 21064 every Saturday around 1700 to 1750Z. It is hoped that he will soon be on around 2300Z for the VK and Asia areas.

BY1SK (Meng, home call of BZ1FB) also runs ARQ and packet. His packet call is VS6UF where he has a BBS.

ZD8BOB says to hold his cards until mid June as he is going on vacation at this time.

Cocos TI9. TI2US stated that the trip is still on, but the exact date is not known as yet. He was not sure about RTTY either.

RE: Donations to the Spratly deal. Do not send donations to NT2X, as the information that I received was not completely correct at the time. More later.

Some upcoming contests you don't want to miss:

April 14: Combined Sprint and Chess contest. Same basic format as Sprint, but stations must work other stations enough times to complete a chess game. On initial contact with a station exchange first moves, (station calling CQ plays White), then sprint at least 5 KHz and begin game with second station, etc. Continue games by finding the stations again one at a time and exchanging one move. Score is number of games played multiplied by number of wins. Draws count half points. No boards permitted. CW only. Brilliancy prizes.

April 21: Olde Phartes Conteste. Exchange latest prescription number, days since last doctor visit and full description of current medical symptoms. Each exchange must last at least one hour. 75m only, use of callsign optional. Contestants must remain alive for the duration of this 24-hr contest.

April 28: Modified CQWW. No contacts allowed with JA, YU or UB stations. Special certificates for stations with total number of contacts in double figures in spite of this limitation.

May 5: 10-10 contest. As for regular phone 10-10 contest, except that operators giving their 10-10 numbers in "dollars and cents" are disqualified from future contests. The contest is therefore not expected to take place in following years.

May 12: Belize Egoists Contest. U.S. stations may work only Belize (V31) stations. Contestants may not use MFJ equipment unless disparaging remarks about it are made as part of the exchange. Belize stations need not give callsigns or follow any usual contest rules, and may flame any callers mercilessly. U.S. stations who attempt to reply to flames are disqualified.

May 19: Usenet Contest. Exchange full e-mail addresses, and opinions on no-code license. Bonus points for creative flaming.

Arun,

I suppose, that the QRP HF transceivers, which You describe in Your mail, are made by MIZUHO (japanese) company.

This transceivers are readily available here in Germany, but in the last (March) Issue of RadComm (Radio Communication, which is the member magazine of britisch RSGB), is an advertisement from british company selling this MIZUHO MX line.

They sell this QRP transmitters for 80, 40 and 20 m (only?). The power ist 2 Watts and each rig is VXO controled. What you get is 25 kHz tunning range in the 80 and 40 m and 50 kHz in the 20 m. One Xtal is supplied (I don't know, how many Xtals can be in simultaneously). Another features are IRT, noise blanker, S-meter, speaker, morse key, BNC socket. You can powered it from AA cells or from external power supply. The size is about 66 mm width, 39 mm high and 142 mm deep.The mode is CW and (perhaps) SSB (I am not sure here, perhaps the mode is CW only, with possibility to receive SSB).

The price in the british magazine is 189 pounds. Sorry, I cannot give you german price, the last issue of ,,cq DL" (which is our radio amateur magazine from DARC) shows no price, only the comment ,,Achtung! Kurzwellen-Mono-Bander jetzt zu Sonderpreisen" (Attention! HF monobander now for special price).

In previous articles
>>... poor contest operators ...
>>... about 5 contacts, during which he never said his call.
>

Yes it's rude when contacted and the operator refuses to give
his call. But then again, there's something wrong with the
operator who hasn't the foggiest idea who the station on the
other end of the pile-up is, but jumps in to work them. That's
poor operating practice too IMHO. There's a pile-up of stations
who have listened long enough (perhaps longer than they should
if the other operator doesn't give his call very often) to know
who's on the other end, and here comes some schmuck with more
kw than patience who jumps in to work the station. The ones
who stand on the outskirts of the pile up yelling "your call [please]"
with no call of their own are about half a step worse than those
who work the station then try to figure out who they worked.

Oh, well I still enjoyed my small part of the contest. I worked
perhaps 30-40 stations during several short sessions on 15M.

The Department of Defence, as a U. S. government user, is administered by the IRAC/NTIA, not the FCC. Ironically, not even FCC operated radio transmitters are administered by the FCC.

If you want to minimize the time to get to 13 wpm , don't bother listening to anything less than 13wpm. Start with the 20 and ramp down to 13 over 30 minutes or so, just write down any letters you make out and don't worry about checking your text, you'll know when you are ready to take the test. You could do a little 10 at the end just to make you feel better. Try to practice once a day, and don't do it if you are tired and not concentrating well.

This was the method suggested to me, and it worked great. I used the same method to get to 20 copying in my head, start with 35 wpm (!! machine-gun fire!!) and by the time W1AW gets to 20, it seems slow!

My only problem now is trying to copy the crap on the air that passes for morse code, :-) (blech).

Message-ID: <9003071534.AA17763@ti.com>
Source record: 13056

Why not just go with a "Computer-Class" license. Not only would there be
no Morse Code requirement; there would be no analog questions on the written,
just digital electronics (after all, the radio part is just another peripheral
device). This would keep out all the OF's that don't want to waste time
learning all the digital electronics and computer terminology, and they
wouldn't clutter up the computer bands with all that CQ contest, and
beep-boop stuff.

>There is an FCC-imposed limit on harmonic content (50 dB ?), but this
>can be hard to accurately measure without a REAL(tm) spectrum analyzer.
>
I was the person who originally posted this item... In any case I have built the A&A engineering spectrum analyzer and it is great fun. Another company sells PCBs/Kits that +might+ be a cheaper way to go... But I am not sure... That company is called Science Workshop.

The main problem is finding an attenuator that can take 1KW+ down to a level that will not fry the spectrum analyzer or find a directional coupler that will do the same thing (although the ARRL handbook says this is not as accurate)..

If you belong to a club, maybe the club could buy the kit and various members assemble it and leave it available for club members use.... But this does not seem practical.

If you have a shortwave reciever around an article in 73 Magazine might work out. This used a shortwave reciever and a scope as well as some logic to interface the two. The accuracy of this will not be very good though.

In article <8462@netcom.UUCP> jxh@netcom.UUCP (Jim Hickstein) writes:
| I have one of those little FM-only Sony Walkman devices, and it has problems
| (no big surprise, there). I want to separate the antenna and audio output
| functions of the stereo mini jack

Fast & Cheap Solution:

Get a short piece of fine wire and wind it around the ground
(or common) connection of the headphone cord. The ground connection
is the one closest to your fingers if you hold the jack like you would
to plug it in. Plug the jack into the socket of your Walkman (this
will wedge the wire in between the jack and the body of the Walkman).
Now connect an antenna (random hunk of wire) to the short wire.

Why this works: Most Walkmans use the shield/common line of the
headphone cord as an FM antenna. Inside the unit, this line is
connected to the FM input of the radio proper through a capacitor and
to the audio ground through a small coil (inductor).

Better reasons to try this: 1) I've done it and it works. 2) It
doesn't require opening your Walkman. 3) It can be undone if it
doesn't work. 4) It's outrageously cheap.

Re: 949C switches

>I think the switch is just under-engineered, and could be corrected with
>a parts mfgr change. There is quite a bit of current on the lowest L
>setting, which is where the switch wiper ate it.

An update.

I replaced the switch, and gave it my standard "wrong end of 75 meters"
test. The new switch held, but the capacitors arced-over at 200W. I
measured the plate separation (.05"), and the Handbook sez this is good
for 1000 volts. Wow. I didn't know a shortened mistuned quarter-wave
ground plane antenna could develop that much reactance.

Anyway, it's time to go to a hamfest and get some REAL(tm) components.
In fairness to MFJ, the 949C works well with barefoot HF rigs in the
100W PEP range. I think that's its intended purpose. I'm able to tune
everything but dead shorts at that power level.

I would expect broadcast-style signals in the 29-31 MHz range to be harmonics.
Of course, harmonics are also found elsewhere, but I hear reports of them
in this area quite often in the DX news info given by Glenn Hauser on
Radio Canada Int'l's SWL Digest program, or in his World of Radio program
on WRNO (& other outlets). In Alaska, I suppose it is reasonable for you
to be picking up harmonics of Soviet and other Asian stations; most of
the ones we hear about down here are Spanish-language.

Get on the air.

The Morse programs teach you how to pass the test but not how to operate CW. Many of my friends are afraid to get on the CW bands because they only copy "sanitized CW" from their PC.

Who knows??? You might even have fun.

Seriously, it is important to be able to get on the air with CW and there are some really nice people on the bands. Not as much "territorialism" as in the phone bands.

Instead of using an RC plane with a TV camera to spot fish, maybe a tethered balloon with the camera would work. The tether would be the coax cable for delivering the video. This gets rid of the problem of broadcasting the signal, and you don't have to worry about flying the plane, or crashing it. You also don't have to worry about running out of fuel, and where to land it.

hope this helps 73 de WA2ISE

>
>--Phil Howard, KA9WGN--

Be aware! This does not provide a "repeater" operation like on your local hilltop (unless it was built by lids) - this "cross-band repeater" isn't full duplex. If you are talking on some two-meter channel and allowing this mobile radio to retransmit that on some 440 channel, you can't hear anything that is going on up on that 440 channel until you release the pickle. Generally, so long as you know this it's ok.
Here in La La Land, we get folks (I like to think of them as the "No Code" types (hi hi)) who buy one of those rigs, then immediately put them on the air as "repeaters" at their house, choosing some quiet channel (usually our repeater input!) as the dump out on 440; then the 2m input is set on some 2m repeater, and there's no end to the annoyance. And there's no way to talk back as the repeater never drops, and none of them speak English anyway (how about a "English Only" license?!?!). (sigh.)

Remember: Radios don't have a mind of their own; kinda like some of their owners.

I believe the international regulations require a KNOWLEDGE of Morse code for HF operation, but I have never heard that they require a code TEST.

I for one would be perfectly comfortable with the idea of Communicators having HF Novice privileges (code only). They can't operate code if they don't know it.

I know of no HF spread spectrum system in the field today. (This isn't to say there isn't one. In fact, I've heard rumors. But I've heard of no production contracts.) The lowest-frequency SS systems I know of (e.g., SINCGARS) are in the 30-88 MHz band, and are frequency-hopping rather than carrier-swept or psuedonoise-spread.

>The other modulation is much greater and results in a widely
>spread frequency spectrum. It is the format of this modulation
>that characterize the communication. There are several advantages
>of the spread spectrum. The "spreading" format is unique for each
>station, and only the authorized recevers know the format. Therefore
>the S.S. is very secure. Secondly, since the energy is so weak (in
>everage sense) in a 10 KC window (that of a radio), the signal can
>hardly be noticed (unless slow formats are used).

And a swept carrier would be about the stupidest method you could use for a SS signal, unless you didn't care about being detected and intercepted. SS is only secure if the enemy can't find enough of your signal to figure out what kind of encryption and hop rate/PN sequence you're using. Sometimes just having your signal *detected* can be deadly, because the enemy can DF on it and blow you away.

>Most US spied use S.S., by the way.

Not to mention the Army. And the Air Force. And, soon, your cellular phone.

Well, I guess I now understand why everyone hates contests so much. I tried in vain to convene the College Net despite the DX contest. Besides having to spend quite a bit of time trying to wedge myself into a nearby frequency I had the pleasure of one OF explaining to me how all nets get closed down for contests. Arrgh!

In any case, I wish to try this net again. However, I think it would be best to wait a few weeks. These next couple of weeks fall within most schools spring breaks. Plus, the weekend of the 24th is CQWW and I have given up fighting international mayhem for the moment. I propose we retry this on the last weekend in March. Thats Saturday, March 31 at 1800Z on 28.425+-. My apologies to Rusty - I have known of your net and have tried to catch it a few times with no luck. Perhaps I'll try this weekend.

I will post a short reminder prior to the end of the month.

Scott

BTW: are any of the College ARC's interested in a radio chess match between our respective clubs?

I disagree with 100% of this. I think there is something really wrong with this attitude that the DX operator's time is more valuable than mine. The DX contest operator is a just guy with a radio, the same as me and everybody else on the band.

> The ones
> who stand on the outskirts of the pile up yelling "your call [please]"
> with no call of their own are about half a step worse than those
> who work the station then try to figure out who they worked.

I disagree with 50% of this. I put those frustrated people on a par with the DX station who is also not signing his call, although I secretly believe the DX station is getting what he deserves when he lets this happen *during a contest.*

I'm all in favor of DX stations increasing their throughput, but not at the expense of selfishly wasting the time of others. I consider the "but it improves my throughput" argument similar to someone saying "when I work a station in heavy QRM and I miss part of his call, it is more expedient to select a few random letters and fill in the parts that I missed."

The ultimate irony in all this is that these ops often spend more time saying things like "Q-S-L Q-R-Z" than it would if they would just say their callsign "X-E-2-blah-blah."

>In previous articles
>>>... poor contest operators ...
>>>... about 5 contacts, during which he never said his call.

The worst case I ever heard was a certain 9Q5 station a year or two ago.
He refused to give his call after many QSOs. One big gun station worked
him and asked for his call. The 9Q5 said he *just* gave his call 5 minutes
ago and would do so again in 10 more minutes!

A couple of people commented that some DX stations don't ID to keep the
pileups down. I think KH6BZF (Bloomin' Zipper Flipper) has the best
way to handle that. Lee turns down his power when the pileup gets too
big. Fewer stations can copy him, thus few call. Keeps QRM down all
around.

My policy on stations who don't ID after several contacts: He is wasting
your time making you wait. I will work him again and ask for his
call. If its a dupe I'm not sorry I wasted his time.

I also keep a band activity sheet during slower times (Sunday afternoon).
I write down the frequency and call of the guys who don't ID frequently.
Later if I tune across him again I don't waste time trying to figure out
who he is a second time.

Time to get back on HF ... I'm looking for a vertical that will cover
80 - 10 metres, including the WARC bands. The antenna will be roof
mounted on a fourplex, so I have quite a bit of room to play around
with radials. It doesn't have to handle full power, since the rig
only pumps out 150 watts or so. Coverage of the 160 metre band would
be nice, but it's not mandatory.

Please email and I'll summarize.

1529. what CODELESS class is FOR

Newsgroup: rec.ham-radio
Date: 1990-03-09 01:41:11 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <30500440@ux1.cso.uiuc.edu>
Source record: 12934

It seems we are getting lots of alternative ideas on new license classes and examination strategies. These ideas I have seen fail to address many issues and are essentially worthless in their limited scope. Therefore I want to bring up some of the issues so that if you get some ideas, you can work on making your idea address the issues (even if the idea is why the issue is not important).

I do in fact like to read other ideas, but I don't get much out of them if they are incomplete.

What is a codeless license class for?

In general it is to provide for a means for people who want to operate only certain subsets of amateur radio activities to be able to do so without having to learn morse code. If you believe that one should learn morse code for these particular activities, please say so and why you believe so. If you have an alternative licensing idea, please include a means to allow these people access to these activities (or explain why they should not have access).

1. microwave experimentation
2. high speed radio networking
3. general packet radio
4. ATV experimenting
5. voice repeater systems and networking
6. public service radio operation VHF/UHF

By no means is the above list complete, but an idea leaving out any of these is also incomplete.

>is not as accurate)..

Uh, what's the problem? You *do* have a dummy load that will take
your transmitter's full power, right? Use that as the input resistor
for your attenuator: something like

```
2.2K (or whatever)
Input---+-------v^v^v^----------+------------- Output
| |
> 50 ohm > 50 ohms
> dummy >

As one who has read the CURRENT rules over many times, I personally would not hesitate to put up and operate such a repeater, provided I can do so without causing intereference to any other communications, and had the equipment to do it.

I would NOT put up a remotely controlled phone patch (not part of a repeater and thus not under automatic control) with INPUT BELOW 220.5 Mhz (or on the 431-433 or 435-438 Mhz subbands). I am giving serious thought to putting one up on something like 446.475 in and 146.475 out, which would be full duplex, and in fact fitting the local band plan simplex channelling with an easy to remember 300 Mhz split.

>
> I believe they required demonstrating such knowledge in advance

International regs require knowledge of code for INTERNATIONAL communications
pivileges, NOT for operations below 30 MHz. Witness the dreaded CB'ers.
They operate below 30 MHz (some of them legally) and are not required to pass
a code test. There really isn't any reason a new class license couldn't
be given a low power HF limit (or high power for that matter) and restricted
to US contacts only below 30 MHz.

Of course, the ideal solution would be to bring back the canned FCC code tests
and anyone who wanted to could memorize the QSOs just like you memorize
the question pool.

I bought a audio spectrum analyzer/equalizer a couple years ago. It was termed a final close-out then and it's still being sold. But I'm satisfied with the merchandise and would purchase again if I found something appealling. I don't much like the cutsey catalog and I deplore the Shipping/handling charge which seems to have no rhyme or reason with respect to actual shipping charges incurred by DAK. I would just as soon see the listed price include the handling (a rather normal cost of mail order business) and the shipping charges could be imbedding the price also. Any premium shipping methods could be surcharged. Gosh, I feel a little better now.

Message-ID: <9003091222.AA23129@bunny.gte.com>
Source record: 12942

Periodically, there have been postings by contesters here. I put together
a writeup for the Potomac Valley Radio Club bulletin on how to access
stuff on the net and there was a lot of interest in E Mail to other
contesters. I including a few addresses I knew, such as KM3T, WN4KKN, K1EA.

I was asked by several PVRCers to put together a more comprehensive list. If
any contesters out there are interested, send me some E-Mail direct and I will compile the
addresses and send the distribution file back out. Big gun, little gun, pop gun, top gun,
whatever, if you're interested or active in contesting
send your net address to PESCATORE_JT%NCSD@GTE.COM and some time in the distant
future I'll compile them.

P.S. My comment on the stations who run a pileup without identifying: I listen
for three contacts, then work them. If it is a dupe we both wasted time. K3NA
calls it the "crow threshold": you should identify whenever the sounds of
"call! call!" rise above the crowd. However, a lot of people start caw-ing
without listening AT ALL.

In the ARRL contest some DX stations were smart and used an odd-ball power
for the exchange, which made it easy to ID the station without the call.
I always knew it was TI2DU when I heard him send 59 900. In the CQ contests,
the zone helps a little but not as much.

Source record: 12943

Just a few comments on the subject of DX stations identifying or not identifying after every QSO. As a "little gun" DXer who has always operated barefoot, and intends to keep doing so, I have learned that listening more than talking results in less frustration and more satisfaction. Yes, it is somewhat frustrating to hear a large pileup and not be able to immediately identify the station at the other end. However, all DX stations do identify periodically. If you are a big gun who has to get in and out immediately, so be it. I have found that if I listen a few minutes I will find out who the station is and usually the QSL information without cluttering up the frequency by asking "Who is this station, where is it, what's your call?", etc.

Some DX stations are more proficient at identifying at short intervals and providing QSL information than others. But if you REALLY NEED the country it is worth a little listening. Good operating procedures do work for chasing DX; listen and make your call when you know the other station can hear you and keep it short. I have heard countless DX stations come back to stations who keep calling and calling and never listen so never hear the DX station calling them.

Use your ears more than your mouth and you may be surprised how many DX contacts you might be able to make.

"Forgiving" presupposes that the forgivee has done harm. Tell me what's wrong with incentive licensing....or incentive anything else for that matter. While there are those who obviously don't like the League, this shouldn't be taken as evidence that it is the Evil Empire.

73,
Dube Todd, N5PDK

I'm looking for some advice on running a ICOM-735 from my sailboat. A good atte
na idea is what I need. I know many folks use insulated backstays but this mod
looks expensive. I have the 3m mobile whip that is sold with the radio. Is this
likely to work? If so how to ground? Are there better options for HF?
Long time no sea - but the season is coming!

Here in the Willamette valley of Oregon we (three different VE teams) recognized some of these problems that VE's go through. WE asked ourselves how could we change things! We got together and agreeded (strange word for hams huh?) to hold a VE session once a quarter and then agreeded upon the second saturday of the month. This keeps each team to only having to do a session every 3 months (less chance of burnout) and gives all the hams in the area a scheduled chance of taking a test.

We contacted the local community college and are teaching novice classes each quarter(the last class just "graduated" 12 novices and 1 tech!). Note that one 12 year old was in the class the rest were > 40!

Can anyone provide me with a schematic and a pin out of IC-315 (CPU)
for the Uniden HR/2510?

Would like to do a comparison between my 2600 and the 2510.

Also, if anyone has any info on extending the range of band segment "D"
from 29.500 to 29.999 Mhz instead of the factory 29.500 to 29.699,
Please drop me a line.

Thank You

Paul Hagar N2FAN Please use CALLUP for address. Poughkeepsie, N.Y.

P.S. = My HR2600 does not have a potted CPU chip!

> The Carnegie Tech ARC (W3VC) plans to buy a 440 MHz preamp soon and
> satellite work. Thanks and 73.

AMSAT runs an ongoing competition in order to encourage people to improve their listening set ups with the hope that they will use less transmit power on the uplink (on average of course ;-). What does this have to with preamps? ALL of the recipients of the top category certificates for quite some time have used LANDWEHR's on both 2 meters and 70 cm. They are available from Henry Radio in LA. If you are an AMSAT member, ask for Jack Sommers, WA6VGS. He will cut a few points of the usual retail. I have both of these preamps and am extremely satisfied with them. I have not made an exhaustive comparison, but these are the best I have tried in twenty years of VHF/UHF/satellite work. The intermod performance is outstanding, they are capable of three different types of keyed switching to several hundred watts or RF sense switched to over a hundred watts. I recommend them highly. I have no connection in any way with Henry Radio, Landweher, etc. other than as a satisfied customer.

I noticed a recent ad for a highr power version of this little gem. You
should maybe look into it.

I would be more interested except that 12 years ago I built a transmatch the
size of a GE Progress Line containing a couple of Johnson amd Millen capacitors
of excessive proportions and all for a price of only double that of an
equivelant commercial unit. (blush, I run 40 W) But it was fun.

Cross-posted to: rec.ham-radio,sci.electronics

My local Radio Shack (and maybe yours too) is having a
sale on their CB radio. It is the Realistic TRC-418 CB
(catalog number 21-1511). Sale price is $49.95, which
is half the regular price of $99.95. No license needed,
extra rugged mic with locking plug (what's a locking plug?)
priority switch for Channel 9 and 19, LED channel display,
5 bar LED signal/power meter, with jacks for PA and external
speakers. They are also selling a magnetic mount CB antenna
(catalog number 21-1006), with a 16 foot prewired connector.
This is a Special Purchase at $15.88.

I am interested in getting one. Is this a:
Good radio?
Good antenna?
Good price?
Any problems/idiosyncracies to be aware of?
Any other recommendations?

Thanks (and 10-4 Good Buddy!) - Ihor
~[:-) couldn't resist that one ;-)

> Does anyone know of any public domain/freeware/shareware morse
> programs for the mac? (I have an SE, 2.5 Meg of RAM, single floppy+HD
> system).

A year ago, another ham gave me a mac disk with programs from Project Mac (from QST?). It had a variety of programs as part of it. It appears from a ReadMe file that Stan Hozepa, WA1LOU coordinated it (Stan, you out there?) I assume my friend pulled it off the net from this group so some others out there probably could give more info about it. The hypercard application is what I liked the best that had a variety of applications built into it, one being a morse code tutor. I use it all the time as I am studying to upgrade my license.

Stan are you out there or does anyne have an e-mail addr or know more about Project Mac? I have some questions about it myself.

Oh yeah, BTW, I've been following this code/nocode debate. Just for the record, for one who is studying code to upgrade: I was reading the ARRL general class license manual an they made a comment about station accessories. They said, "There are a number of station accessories that make the difference between simply operating a radio and having a full awareness of the communications medium called Amateur Radio." The philosophy between "simply operating a radio" and understanding Amateur Radio seems to be the difference in the debate that goes on. I don't really care about others but for me, one of the enjoyments of getting into the hobby of Ham Radio is to learn about Ham Radio - which includes morse code. Enough....

Excerpted from the Macintosh ham software list I recently posted:

COLLECTIONS AND MISCELLANY

"Project Mac"
Contest logging, antenna design, satellite tracking, clip art, etc.
Microsoft BASIC required for many (but not all) of the programs.
Stan Horzepa WA1LOU, 75 Kreger Drive, Wolcott, CT 06716.
Send three formatted 800K Macintosh disks with stamped, self-
addressed return disk mailer.

****

However, Stan tells me that virtually all of the Project Mac stuff
plus lots of newer programs are in the MacNet collection, to wit:

****
MacNet
Public-domain programs (currently on nine disks) contributed by
Macintosh packet users. Includes test preparation, contest logging,
propagation prediction, satellite tracking, and amateur television.
John D. Seney, KB1HE, 144 Pepperidge Dr., Manchester, NH
03103. Send formatted 800K Macintosh disks with stamped, self-
addressed return disk mailer. Contributions of public-domain
programs encouraged.
****

>I assume my friend pulled it off the net from this group so some others out
>there probably could give more info about it.

I'm not aware that the Project Mac programs have been posted to Usenet
or are archived on any Internet sites. I'd like to know about the latter
if there are any.

From: bnewton@atleng1.atl2
Message-ID: <164@atleng1.atl2>
Source record: 12956

I have a Yaesu FT-727 dual-bander HT and I have set it up to receive (and transmit) out of band. I did this by resetting the microprocessor and giving it the code 111111 instead of the normal six digit code. The LCD will display from 100-200 MHz and 400-500 MHZ. However, I can only receive signals within about 10 MHz of the ham bands.

I really want to pick up 162.55, etc., and I would like to know if anyone knows how to increase the receive range. I imagine it is an out of range IF problem. Please e-mail replies.

Thanks, Barry Newton

Source record: 12957

These contests are run by the magazines, right? So if you hear that rare-station-X is violating the rules by not making a complete "exchange", including his callsign, in each contact during a contest, why not write or call the magazine and make a formal protest, asking that they disqualify any contacts with that station and any entry from that station from consideration in figuring the scores of the competitors?

Maybe they'll ignore you, or maybe they will reject your contention, but, if you don't DO that, it doesn't seem you have any right to complain about this conduct. As long as it tacitly or explicitly accepted, and there is no attempt to counteract it, it must be OK and THEN you should begin to press for the written rules to be revised to accord with the reality.

There seem to be enough paths for publicizing such things in the ham radio hobby that it wouldn't be possible for such formal protests to be quietly ignored if you pushed them.

Regards, Will

>If Incentive Licensing is so great, then why don't other countries practice
>it, too?

Say what?? Many--I'd bet most--countries certainly do have multiple
license classes. To take a few random examples from the DX Callbook:

Spain: 3 classes
Ireland: 1 class
England: 2 classes
France: 4 classes (3 if you don't count the one you get simply
by holding the highest license for a certain time)
Ecuador: 2 classes
Lichtenstein: 4 classes
Netherlands: 4 classes
Japan: 5 classes
Italy: 1 class

Granted, few countries have as many classes as we do, but the *concept*
of greater privileges as a reward for passing more tests is clearly
very popular.

I think . . .

you need to make sure that at the operating frequency, the reactance of
the unloaded transformer is very high (so little current will be drawn
when the transformer is unloaded).

> I disagree--vehemently. In fact, I can't understand why incentive licensing
> has suddenly started taking such a bashing. I got into amateur radio about

First of all, Incentive Licensing is occupying a LARGE number of the class slots in the FCC computer. The FCC is making it clear they do not want to change their computer system. Since Incentive Licensing is taking up a large number of these slots, those who don't feel it is working are quick to call for its removal. The FCC has also opened up this new can of worms by proposing the deletion of the Novice and Technician classes. Petitions have been for just adding a class, but the issue is getting to be more one of restructuring the entire amateur licensing system.

> 15 months ago only because I wanted to fly my R/C planes on 6 meters. It

> there to help. To hell with the rest. Amateur radio doesn't need them.

If what you want out of incentive licensing is to squeeze most of the hams into a smaller amount of space, then I guess it is working. I recall the ARRL saying something entirely different at the time; something about increasing the competency level (theory AND code) of radio amateurs.

I'm not convinced that we need FIVE different levels (one of them being an EMPTY level, i.e. no HF privs for no code) of HF privs.

If Incentive Licensing is so great, then why don't other countries practice it, too?

In fact, all the I.L. really gets done is create yet another layer of the "haves" and the "have nots".

In order to not get foreign hams mad at us, we probably do need to keep some band segments relatively clear of the intense density of US hams. We can do this in many ways. We can keep TWO or THREE (but NOT FIVE) levels of HF privs and get the same effect. We can ALSO promote VHF/UHF MORE and HF LESS.

Compromise is the name of the game.

Many suggestions have been made and many more are coming. Good ideas are encouraged; ideas that are well thought out and consider all aspects of the problem. Send contributions to the hamlicen@vmd.cso.uiuc.edu mailing list. E-mail to ME for instructions on how to get on the mailing list and discuss actual and realistic ideas.

This is not actually a reply...

I was wondering how you determine just how many winds are needed for a transmformer. I'm sure 2 winds and 32 winds of #2 copper wire on an air core are not going to do well when connected to the 110 volt mains.

>73's de Syl VE5ZX

Well, I tell you what. I recently downloaded a program (CW311 or something
like that) which uses your 'standard' serial port on your PC compatible
to control your HF rig. I don't know if it accepts keyer input, but
it does accept keyboard input, with a pretty nifty typeahead buffer
(I got about 50 characters ahead of the code before I ran out of
'now is the time' text :-)). I've only run it once since I found out
that it is designed more for sending code than for practicing it.

In any case, I'll make you (and everyone else here on the net) the
following offer:

Send me a FORMATTED MS-DOS disk (3 1/2" 1.44 or 720k, or 5 1/4" 360k or
1.2 meg), or even a DC300 or 600 cartridge (urg! :-)), with return
postage, a note saying that you want the code programs I mentioned
here, and a self-addressed return label, and I'll put CW311 on it,
along with the 2 or 3 other morse programs I've got (SuperMorse and
Morse, I think... there may be another one, too). If you send me a
360k disk, and you are more interested in the learning programs than
in the sending program, tell me so, since I'm not sure they will all
fit on a 360k disk. Also, tell me if you need the PKZIP unarchiver,
since thats the format they come in....

If you are using something other than a PC, sorry about that,
these are PC (XT/AT, i.e. IBM compatible) programs only...

Oh, yes - an address! What with the weather, you may want to send
disks to my P.O box (it is a little more protected from the
rain/snow/whatever): Rusty Carruth, P.O. Box 461, Lafayette, CO 80026.
But, you can also send it to my home: 1260 Forum Drive,^^^^, CO 80026.
(It will be a little faster that way, since I don't always get to the
P.O. box every day, but more at risk for water damage!)

If I get deluged with disks, it may take me a while, but I'll try
to do my best...

Oh, if you want email acknowledgement of your disk, send me your
email address too.

Well, I've not 'done it' yet, I'm currently working on it. I'm listening to a tape while drivingn to and from work (not the whole time, maybe 5 to 15 minutes each way), and I've begun using one of those morse code programs on my AT (confusible, not the 'true blue' stuff :-)). The tape sounds like about 15 wpm chars with 13 wpm spacing, I'm running the program in keyboard copy mode, with chars at 18 wpm, spacing determined by how fast I get the character right (probably not the best way to do it, but I'm having fun anyway). I'm adding 'new' characters in groups according to the way the tape does it (since I never learned D and B solidly, for one thing!). I plan to do some listening to 'the real thing' on HF soon, and I'll probably do some practice writing things on paper to see if I can overcome my writing problem...

> If we knew what we were doing, it wouldn't be research

Ah! I'm researching morse code! :-)

>KF0CA

There have been quite a few articles in 'recent' years about how
to make a 'poor man's spectrum analyzer'. most of the articles
(Ham Radio, QST, 73) based the design on the use of a modified
TV tuner. One article (wireless world? hmm, don't remember, sorry)
used a few IC chips, with no help from a TV tuner.

I believe any one of the above could be built for under $100.

Not quite bits of wire and canning jars, but pretty close! :-)

I would also be interested in any other ideas people have (which
is why I posted rather than mailed).

P.S: Perry, since you are so close, and since I've got a "Real
Spectrum Analyzer (TM)" now (not calibrated, however :-( ),
I'd be happy to let you come over and use it. Warning -
it weighs 175 pounds, so you'll have to come down to my house...

Probably one of the most frustrating things about trying to run a net on 10M, in my VERY inexperienced and Humble Opinion! That and being able to hear people 5-9 and having them not even be able to hear you call them back...

>I had the pleasure of one OF explaining to me how all nets get
>closed down for contests. Arrgh!

Boy, I miss out on all the fun! :-)

>apologies to Rusty - I have known of your net and have tried to catch it
>a few times with no luck. Perhaps I'll try this weekend.

No apologies needed. I'll try to remember to look for you folks on march 31, also. Probably won't say much, I've been out of school for quite a while...

In any case, good luck with your net! I will say that an hour of calling CQ with no response can be very frustrating, though.

73 to all, and hope to cu on the un-net (today, even! :-))

SpaceNews
=========

MONDAY MARCH 12, 1990

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world on UseNet and Amateur Packet Radio. It is available for UNLIMITED worldwide distribution.

* STS-31 NEWS *
===============
A series of background briefings on the Hubble Space Telescope, the deployment mission, secondary payloads and the astronaut pre-flight press conference for Space Shuttle mission STS-31, now set for launch on April 12, will be held March 15 and 16 at the NASA Goddard Space Flight Center, Greenbelt, Md., and March 19 and 20 at the NASA Johnson Space Center, Houston.

Briefings will be carried live on NASA Select television, available on Satcom F2R, transponder 13 at 3960 MHz. Two-way question and answer capability will be available at other NASA centers and at Headquarters.

During the mission, media wishing to focus attention on the Hubble Space Telescope activities are advised to contact Goddard Public Affairs, 301/286-5565, to arrange for accreditation at the Goddard News Center. Goddard will operate a 24-hour-a-day newsroom during the mission and will have telescope scientists and managers available for briefings and interviews.

[From: Peter E. Yee @ NASA Ames Research Center, Moffett Field, CA]

* UOSAT NEWS *
==============
UO-14 continues to run the FORTH DIARY on the 1802 OBC, using Data formats distributed just after launch. The development, publication and implementation of downlink data formats for OSCARs is a delicate business, especially early in a mission. We do not want to publish data formats if they are likely to change quickly, lest people waste their time implementing software which will later become useless. On the other hand, if we do not publish formats, you cannot listen to the satellites - and that's what they're there for!

In the next month, we will be changing operating regimes on UO-14, as the PACSAT Communications Experiment is brought on line. Once this happens, asynchronous data formats (as used by the DIARY) will give way to synchronous, AX.25 packet formats.

As soon as possible, the PACSAT Communications Experiment on UO-14, and the BBS systems on PACSAT-OSCAR-16 and LUSAT-OSCAR-19 will be brought on line for general use. All three of these satellites will be running the same software, using the same protocols - developed jointly by UoSAT and AMSAT-NA. NK6K and G0/K8KA have already published a standard for a broadcast (e.g. bulletins and whole-orbit-data protocol. A final specification should be distributed soon, and early transmissions from the UO-15 PCE will use this protocol. Specification of the message-transfer protocol is well under way.

Thus, the stable state, which we expect to reach sometime this spring, is that UO-14, PO-16 and LO-19 bulletin boards will be accessible with the same groundstation protocol software. Broadcasts from these satellites (e.g. bulletins and whole-orbit data will also come down in a single standard data format. Until we change this state, groundstation software developers are advised to make their programs modular and be ready to revise!

Downlink Modulation:

UO-15 is capable of transmitting either 1200 bits/second AFSK (as used on all previous UoSATs and currently transmited by UO-15), or 9600 bits/second FSK. Ultimately, the PACSAT Communications Experiment on UO-15 will support only 9600 bps FSK. During the transition from DIARY operations to PCE operations, however, we will also be transmitting AX.25 packets at 1200 bits/second AFSK. Like DOVE, this should be copyable with a standard, unmodified, TNC.

[From G0/K8KA via OSCAR-11]

1569. dual_gate mosfet mixer

Newsgroup: rec.ham-radio
Date: 1990-03-10 21:50:18 UTC
From: elzea@sersun0.essex.ac.uk
Message-ID: <3353@servax0.essex.ac.uk>
Source record: 12974

I have designed an unbalanced mixer (frequncey changer) using 40673 dual_gate

mosfet which I belive needs a voltage level of 1V at it's local oscillator port

in order to function correctly. The output from my local oscillator is

in the order of 0.4V, but I still get the right frequencey at the output,

can anybody explain please?

thanks in advance,

1570. NASA Prediction Bulletins

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

1571. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-03-11 01:56:35 UTC
From: tkelso%galaxy@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9003110802.AA13704@ucbvax.Berkeley.EDU>
Source record: 12976

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

> While different methods propbaly work for differnt people, I'm curious
> to see how most of you went about it.

I learned the code starting at 5 then 10 then 15 then 25 then later 55.
By learning it in steps I don't have trouble copying even the slowest of
signals.

I have taught it both ways. I prefer the steps, but it takes longer. If you
learn it listening to fast characters spaced out slow, you will have trouble
copying slow code.

> Thanks!
> -- Peter

Just my own methods!

73 - Rick.

We have had numerous lockups. Must energize the software reset code to reset the controller. We have a clandestine call sign that shows up as WB6AAX (or similar, think it's the guy at ACC). A bug fixed in V3.41 was not being able to voice over-ride a list of mail box msgs. So in V3.42, ACC tried to fix it and now trying to voice over-ride (key-up during listing), the controller switches to CW call signs. We also have the word 'safe' showing up in call slot 33 even thou it is programmed with a valid call sign. This is intermitent. Ok, that's some of the buggers I've found. There's more less apperent bugs, I'll dig them up and post them soon. Also, the ACC notes used to be great reading. Now, seldom published, the notes are more or less a quarterly broshure of ACC products, kinda like to 'cutesey DAK catalog. But ,at least, ACC went to the trouble,time,expense to publish a good newsletter in the beginning.

So much for the bitchin'. The 850 is still, as afar as personal experience, the finest repeater controller available. I wish our club had the money to buy the DVR, computer interface, IC-900 interface, and all the other available options. But, alass, bongo dollars. Hence the desire for a more afordable controller with the same abilities on a PC based system. Any ideas?

I have been out of RC'ing for about 8 years now, but my gear is still
crystalled up on 6 meters. At that time the standard frequencies were:

53.1, 53.2, 53.3, 53.4 and 53.5

No doubt this has all changed..

I have a Fujitsu Ten 450-470 commercial tranceiver (model # FTM40-3092H). This is a 16 channel scanning synthesized mobile radio.

I'm looking for a way to be able to program the radio down into the ham band. It currently on 453 Mhz. I have the programming prom for the radio and, of course, it will not allow entry of freqs below 450. I called Fujitsu and you can guess what their response was after they figured out that I had a programming prom. So here I am. This is a nice radio and I only have limited use of it in the commercial segment. If anyone knows any way to get around the programming restriction, I'd appreciate any responses.

Source record: 12881

A transformer is designed so that the voltage on the secondary does not drop appreciably under load. This requires the use of an iron core to reduce leakage. The number of windings in the primary is determined by the size and type of the core as well as the frequency involved (60 hz on the main). As a general rule, small tranformers have about 8 turns per volt on a 1 inch square cross section core per volt and a magnetic path of 10 inches or so. Of course the turn ratio will be whatever is desired by matching impedances to the load.

The code is specifcally required for HF operation by amateurs - not land
mobile, which is what CB is technically.

Or maybe one of those anti-aircraft barrage ballons that look like a miniature diribible. It's pointy and has tail fins. It would tag along behind a moving boat like a well trained puppy.

>Dube Todd, N5PDK

Since 1968 when incentive licensing went into effect, the number of new amateurs as a percentage of the increase of general population has declined every year except one. From 1946 until 1968 the number of new amateurs was increasing faster than the rate of general population growth. From 1968 to 1972 over a dozen old line American amateur radio equipment manufacturers went out of business. Since I was there (first licensed in 1963), my opinion is that incentive licensing is directly responsible for halting the growth of amateur radio in this country. Like many of my peers who held the General class license (which was THE license and conferred ALL privledges before 1968), I found other things to occupy my limited spare time than amateur radio after I was told I had to take two more tests to get BACK what I had already earned. The advent of packet and satellites finally caused me to grit my teeth and upgrade. In my opinion there should be ONE class of license; AMATEUR. Paper chasing, whether it be DXCC or INCENTIVE licensing, is a disease and the cause of most of the problems in amateur radio, and perhaps in American society in general.

PROTOTYPE 905-MHZ DIGITAL RADIO COMPLETED

The first prototype 905-MHz "user" digital radio has been completed. The intent of the prototype phase was to arrive at a reproducible design using readily available components which could provide good performance at low to moderate cost. These radios are intended to provide moderate speed, 250 to 500 kbit/s, user access to an Amateur Radio network.

The prototype radio consists of four boards, PA, LO, RX and TX, mounted on a U-shaped chassis. This modularity was used to facilitate design; the pilot run design will be more integrated. The present effort involves laying out two PC boards, one for the PA and another containing the entire low-power radio, power and control circuits. It all appears to fit in a 5- x 7-inch enclosure with a top consisting entirely of a heat sink. Interface to the radio is differential ECL: TXD, RXD, RTS, DCD and S-meter output, antenna connecor and 12 V dc @ 0.3A on receive and under 4A on transmit.

An attempt was made to produce local oscillator signals of good signal purity and stability. This was thought to be important since similar radios will probably be used in the near term at backbone IP switch sites and will need to operate in congested RF environments. There has also been some thought given to full- duplex operation of this hardware, but such operation is not being considered at this time. Dual outputs of +10 dB at approximately 96 MHz and 764 MHz are provided for transmitter and receiver mixing. Both output frequencies are derived from a single crystal oscillator. Spurious signals are below -80 dB.

Transmitter output power is in excess of +41 dB (12 watts) with modulation related sidebands down at least 70 dB (at 250 kbauds, modulation index equal to 1.4) at the edges of a 2-MHz wide, 905-MHz centered channel with out of band spurious performance also over 70 dB down (this excludes the second harmonic which is approximately -60 dB). Suppression of adjacent-channel interference is achieved by control of the deviation and an active filter ahead of the VCO tuning input. The VCO is presently free running at 45 MHz and doubly converted up to 905 MHz. This provides 905-MHz output frequency stability and accuracy essentially the same as that of the 45-MHz VCO alone.

This performance seems acceptable, but alternative plans are being considered for providing complete crystal derived frequency accuracy along withfast transmit start-up and 0.5 Mbaud sorts of modulation, if necessary. The present architecture has the advantage of being easily adapted to transverter operation by a slight change of the crystal frequency and the substitution of a multimode HF transceiver for the 45-MHz VCO and receiver demodulator circuits.

The receiver has good BER down to below -90 dB. Turnaround time is better than expected. Since adding a little design effort to the switching circuits, it is now possible to square-wave modulate the RTS (PTT) line at rates of several kilohertz and generate a clean RF square wave at full power. In between these square-wave 12-watt output pulses, the receiver is able to demodulate a -90 dBm signal applied to the same antenna connector (with a 30-dB power attenuator inserted to protect the signal generator). The receiver is fully alive less than 40 microseconds after the falling edge of RTS. It is truly a "packet radar" and calculations show that with an 8-foot TVRO dish antenna or something similar, the radio should be able t copy its own packets reflecting off a 747 aircraft at a 4 to 10 miles distance. In normal use, the radio should easily be back on receive before the previously transmitted packet has reached a distant node.

The first pilot run is expected to be twelve radios and will undoubtedly reveal some areas where change can improve performance and reduce cost. Some thought is being given to a "one-board" lower power radio which can plug into a PC slot. To reduce cost, such a radio might use the phased-lock of an on- hannel FSKed VCO instead of the dual conversion approach.

PC board design is presently in progress for the pilot run radios. It is anticipated that these will initially be used as backbone/switch radios as well as for user access radios as a part of the prototype Northern California moderate speed IP network now being constructed. Plans have not yet solidified for construction of additional radios, but it is expected that the next design effort will be aimed at providing similar radios for ee digital allocations at 1249, 1251 and 1298 MHz.

TEXNET-TNC 2 FIRMWARE ON THE HORIZON

Some of you may have heard rumors of the effort to transport the TexNet software to TNC 2s, which would support smaller "feeder" networks to link to the larger long-haul backbone networks, among other uses. This effort continues and second beta testing is underway and going very well. No releases are yet available.

MICROSAT SOFTWARE DEVELOPMENT REPORT

Some of you might be wondering what we (Harold Price, NK6K, and Bob McGwier, N4HY) are doing with the MICROSATs and why you can't connect up yet.

The development cycle for these launches was very short. Most of the time available for software development, beyond getting the basic operating system and I/O drivers running, was in writing support code for ground-based hardware heck-out. A fully operational CPU wasn't mated to a fully operational spacecraft until very late in the game. After that, much of the available software time went into qualifying the ROM-based bootloader. Given the short time available, the goals were to:

l) Check out all of the hardware on the ground.

2) Have the best chance possible of getting good telemetry as soon as possible once the spacecraft reached orbit.

This resulted in a limited-feature, but very reliable set of launch support software. This is the sftware that was running when the transmitter-on commands were sent.

Once the satellites were in orbit, several shortcomings in the high-level software loader and the battery management routines were seen. Bob and I have been working to fix these, in addition to commissioning the ground-stations which have never talked to MICROSATs before, and spacecraft which have never talked to the ground before, times 4. Once procedures are worked out, they are documented so that new command stations can be broughton line.

Here is a typical day in the life of Bob and Harold. Each day has been like this since launch (times approximate).

1200-1600 UTC: Bob wakes up, reads the mail from Harold for the previous night's passes, copies the early passes, checks the action of the software loaded last night, reconfigures the spacecraft as required, finishes testing the new command and control software for the next spacecraft, and sends it to Harold.

1500-1800 UTC: Harold wakes up, reads the mail from Bob, gets the new command andcontrol software from Bob, integrates it with the new loader code, and tests it on the spacecraft CPU simulator.

1800-2000 UTC: Harold goes to TRW, starts the upload of the new software to the spacecraft (this is a bit tricky, which is why a new loader is being sent). The TRW ARC crew tapes or copies the other spacecraft in real-time. Harold reviews all of the telemetry for all of the spacecraft.

2200 UTC: Harold sends .EXE, which was partially uploaded to Bob to finish the uploading, sens a list of the diagnostic variables to the WEBERSAT ground-station crew to download on their next orbits or calls them to coordinate the use of uplinks to allow the WEBERSAT ground-station crew to access their experiments.

2200 UTC: Bob prepares and tests the new command and control software for the next spacecraft. Harold works on making the ground upload software distribution. The WEBERSAT ground-station crew tests the final camera code on the software simulator at Weber in preparation for it sending to Harold

to run on the hardware simulator.

0100-0400 UTC: Bob completes the upload of the new software, prepares the source code for the next spacecraft for the start of the new cycle, answers fan mail, and calls Harold to confirm that the software is uploaded.

0400-0600 UTC: Harold goes back to TRW, holds his breath, tells the spacecraft to terminate the old program and start the new one, calls Bob to discuss the day, and gets a call from Weber on the diagnostic values. Bob goes to bed.

0600-0800 UTC: Harold and the TRW ARC crew tape or copy the other spacecraft in real-time and review all of the telemetry for all of the spacecraft. Harold puts the status message on Telemail.

1200 UTC: Bob wakes up and starts again.

Coming events: Harold and Bob polish their resumes as the above schedule leaves no time to pick up their pay checks, let alone do work.

Once the basic hardware is checked out and the batteries are in good shape, this frantic schedule will change. And once the loader and command software are tweaked fr the last time, they will be turned over to the production command groups, hopefully by the beginning of February.

The next goal is to load the application software. Weber will be ready to do that in a few days. I have to take a business trip and more development needs to be done, which will delay the uploading of the first user-access software until late February. This will allow time for the final hardware check-out, which will include memory tests on the 8-Mbyte of mass memory, determintion of the channel center frequencies, required uplink power, and the like.

by Harold Price, NK6K

SOFTWARE FOR THE PACKET-RADIO STATION

Lately, a lot of new and updated software for the packet-radio shack has become available. A synopsis of these programs follows.

APLink Version 3.94, the IBM PC AMTOR mailbox/packet-radio BBS software package, fixes a minor bug in the packet-radio log-off routine. The software is available on disk from TAPR.

Atari TCP/IP (KA9Q's NET) has been released by PE1CHL in a new version for the Atari computer. It is available directly from PE1CHL, however, TCP/IP fans in the US can obtain it by sending two double-sided or three single-sided disks, a self-addressed stamped disk mailer and a note stating what you want to Mike Curtis, WD6EHR, 7921 Wilkinson Ave, North Hollywood, CA 91605- 2210.

from Julian Macassey, N6ARE

DOSgate Version 1.13 is now available. This version should be compatible with most TNCs and has been tested with the AEA and Kantronics TNCs. DOSgate is an IBM PC program that allows any remote packet-radio user to connect to and use a PC compatible computer as if the user was sitting in front of the PC (see Gateway, Volume 5, Number 23). To obtain a copy of DOSgate, send a 360-kbyte formatted 5-1/4-inch DOS disk, a self-addressed stamped disk mailer and your request for DOSgate to Rich Bono, NM1D, 7 Redfield Cir, Derry, NH 03038.

DRSI TCP/IP PC-Packet Driver is available in a new version that fixes all of the reported bugs in the earlier releases, nowsupports the NOS version of TCP/IP and marks the first release of the source code for the DRSI drivers. The pexecutables and DRSI driver source files may be downloaded from CompuServe's HamNet (file name: DR_NOS.ZIP) or may be obtained on disk from DRSI, 2965 Range Rd, Clearwater, FL 34625.

G4YFB Packet Mailbox Version 3.24 for the IBM (C and compatibles may be downloaded from CompuServe's HamNet (file name: YFB324.ZIP).

G8BPQ Packet Switch Version 3.53 has a number of changes and enhancements including a remote SYSOP feature for etering route/node information, node CTEXT for users accessing the switch via its alias, a BYE command and STATS information.

from Carl R. Finke, WB5DDP, via CompuServe's HamNet

KC8JN PBBS Version 8.21 for the Radio Shack TRS-80 Model I, III or IV (in the III mode) includes reverse-forwarding and BID store-and-forward. It is available by sending three unformatted 5-1/4-inch disks plus $2 (to cover mailing and documentation costs) to Bill Ritchie, N8FIS, 725 Rawson Ae, Fremont, OH 43420. Note that Bill is only able to copy the Model III disks because he does not own a Model I; anyone that wants to run this program on a Model I will have to convert it themselves.

MSYS Version 1.06, the IBM PC and compatible multiuser, multiport PBBS with support for TCP/IP, gateways and packet-radio clusters may be downloaded from CompuServe's HamNet.

PRMBS Version 1.05, the ROSE packet-radio mailbox and server for the IBM PC and compatibles fixes two major problems: the crash- inducing response to a non-standard "Link State is" message generated by a Kantronics KPC-4 and the failure to detect carrier loss of a landline modem connection in the "super-user state." The software may be downloaded from CompuServe's HamNet. The software is also available on disk from TAPR.

W0RLI Mailbox Version 11.8 removes support for MBL3.13, port types AEA and KAM, which is no longer required, and the line "?_name" from config.mb; fixes several cases of mail file corruption when GM. and several different TC hang situations; and adds the V command (like T with FLOW ON). The software's file name is FS1108.EXE and it may be downloaded from N1EDF at 508-949-3590 or WA6RDH at 916-678-1535. The software is also available on disk from TAPR.

WA7MBL PBBS Version 5.13 adds limited support to hierarchical-addressed messages. It may be downloaded from CompuServe's HamNet or via anonymous ftp on Internet from either tomcat.gsfc.nasa.gov (\public\bbs\wa7mbl) or biocat.chem.usu.edu (\pub). Its file name is MBL513.ARC. The software is also available on disk from TAPR.

Gateway Column

Packet-Radio Satellite Tracking Programs

The recent launches of amateur packet-radio satellites has generated a lot of interest among packeteers worldwide. In order to use the satellites, it is necessary to know when they will be "visible" to your station. To find out when satellite visibility occurs, the following satellite tracking software is available from the Radio Amateur Satellite Corporation (AMSAT) at PO Box 27, Washington, DC20044, telephone 301-589-6062. Write or call AMSAT for pricing and ordering. Note that the software is discounted for AMSAT members.

"InstantTrack 1.00" for the IBM PC and compatibles was written by Franklin Antonio, N6NKF, and features speed, ease of use, instant visibility, real-time displays, automated orbital element entry and time-setting, satellite and station databases, a 1754 city database, grid square support, satellite co-visibility, squint angle, path loss, real-time rotor control, background moe, sun and moon tracking, fast rise-time finder, multiple station tracking and on-line help.

"Orbits II" is for IBM PCs and compatibles with 256-kbyte of RAM memory, CGA and compatible monitor, one 5-1/4-inch floppy diskette drive and DOS 2.0 or later.

"Orbits III" is functionally equivalent to ORBITS II, but has been designed for use with EGA and an Enhanced Color Display.

"Orbits IV" is the equivalent to ORBITS II, but has been designed for use with VGA.

"N4HY Quiktrak 4.0" is for IBM PCs with DOS 3.0 or later. An 8087 math co-processor is not needed, but the program will run much faster with it. CGA requires 512-kbyte of RAM, while EGA requires 640-kbyte of RAM.

"Quiktrak For IBM" is for IBM PCs without graphics capabilities.

"C-64 Supertrac" for the Commodore C-64, combines N4HY's Quiktrak program and enhanced graphics. It provides sharp, clear and colorful graphics with excellent scheduling flexibility. This program also has the ability to drive commercially available dual-axis rotors. It is available on disk only.

"Apple Quiktrak" is an Apple II menu-driven program for tracking and scheduling of amateur satellites. It incorporates a very fast algorithm for finding usable passes of the satellite of your choice. Satellite pointing angles relative to your QTH and a "window track" mode are included. The window track feature identifies mutual "windows" between your QTH and other

specified locations around the world. It includes menu driven utilities fordata entry and requires an 80-column card and 64-kbyte of RAM.

"Satellite Helper," written by W7HR for the Apple Macintosh, provides tabular data output of tracking and scheduling information for up to ten satellites. Graphic displays include rectangular, polar and great circle world maps, and there is a "view" mode which shows the Earth as seen from the satellite at any time. A real-time mode displays data as it changes and is compatible with the KLM/Mirage antenna tracking interface. Data can be displayed on the screen or printed on an Imagewriter printer. A propagation prediction package is also included which calculates the maximum usable frequency (MUF) to any point, sunrise and sunset times, bearings and distances, and displays the gray-line. Satellite Helper requires 1-Mbyte of RAM.

"C-128" is a version of the Orbits program that is written to take advantage of the unique capabilities of the Commodore C-128. It uses time-based incrementing with user-selected increments of time, which results in uniform time increments btween data lines. The program features automatic page formatting and pagination. As many as 20 satellites may be entered into Keplerian files. It requires an 80-column monitor and a Commodore compatible printer.

"Commodore Amiga" is designed for the Amiga operating in 80-column mode. It has the same features as C-128, but runs considerably faster. The program has provision for mode and phase programming to alert you as to which transponder is active. It requires 256-kbyte of RAM.

"Quiktrak for TRS-80 Model 4/TRSDOS 6.0" is the N4HY Quiktrak program modified to run on the TRS-80 Model 4.

"W3IWI Tracking Program" is available for the following computers: Tandy/TRS-80 Color Computer 1, 2 and 3 (cassette or disk); TRS-80 Model 3 (32-kbyte of RAM, one disk drive); Atari 400 and 800 (disk only); Each program provides all of the data needed for tracking satellites, space shuttles, etc in an easily understandable tabular form.

"HP-41 Programmable Calculator Orbit I" will output azimuth and elevation in real-time or all W3IWI arameters in the prediction mode. Special requirements: HP-41C plus QUAD Memory, HP-41CV, HP-41CX; Card Reader is desirable, but not essential.

"HP-41 Programmable Calculator Orbit II" is the same as Orbit I with the addition of functions from the Time Module for output of time and input from the time clock in a real-time mode.

GATEWAY CONTRIBUTIONS

Submissions for publication in Gateway are welcome. You may submit material via the US mail or or electronically, via CompuServe to user ID 70645,247 or via Internet to 70645.247@compuserve.com. Via telephone, your editor can be reached on evenings and weekends at 203-879-1348 and he can switch a modem on line to receive text at 300, 1200 or 2400 bit/s. (Personal messages may be sent to your Gateway editor via packet radio to WA1LOU @ N1DCS or IP address 44.88.0.14.)

The deadline for each installment of Gateway is the tenth day of the month preceding the issue date of QEX.

RTTY DX Notes, 1of3, 3/9/90

RTTY DX Notes for Weekending 9th March 1990.
Part 1 of 3.
BID: $RTDX0903

A point to ponder. This week I received reports of 370 stations; some
of them rare DX, some good DX, some just DX, and finally, others who
were just normal stations. What does one leave out and what does one
use? As you can imagine, the editing pencil had a lot of work to do to
keep the notes to a reasonable size. I am not complaining, just
indicating that if the stations that you reported do not appear, its a
case that for this week there were some rarer stations around. But
thanks all the same, and keep up the good work.

Our thanks this week go to BV4VB, I5FLN, JA1BLV, JG1NBG, KT7H,
OD5NG, TG9VT, VK2EG, VK2KM, W1DA, W2JGR, W6/G0AZT, W0LHS and the
Tri-State DX Association VHF packet cluster. Thanks, chaps for your
efforts. They really assist with the work.

RTTY DX Notes, 3of3, 3/9/90

RTTY DX Notes for Weekending 9th March 1990.
Part 3 of 3.
BID: $RTDX1103

ZP6XDW has Box 73, Caacupe, Uruguay.

HH2BZ says to QSL via N1DRS.

ES7JW to Box 73, Viljandi, 202910 USSR.

LY2WW is Gintas Sakenas, Box 2237, Vilnius 232050, Lithuania, USSR.

PJ4V will QSL via WD4JNS.

LQ19DX QSLS via Box 36, CP-1834, Buenos Aires.

V31HQ says to QSL to DL1ZBP.

ZL0AIC says to QSL via HB9AAA.

CE0ZIG says to QSL via NR8J.

GJ4YMX QTH is Box 437, St Helier, Jersey, C.I.

BV4VB will QSL via Box 146, Taichung, 40099 Taiwan.

Notes of Interest:

UA3DK and RW3DX with UA3DZ are reported to be starting activity as 3W3DX, 3W3DK and 3W3DZ after March 13th. QSL 3W3DX to Box 145, Dubna, 141980. 3W3DK and 3W3DZ go to Box 45, Dubna.

Spratley is still on course for 15th March to 30th March, but there appears to be some problem with donations from the U.S.A. It is suggested that you do not make donations until you have consulted with your local foreign assets control office, or whatever it is called in your country. There could be large problems if advice is not received.

OH2BH, Martti, reports that his trip to Aves Island depends on a naval vessel being repaired in time. More later.

The TI9 operation also depends upon a naval vessel being available at the required time, and even so it may only be a 16 hour operation.

VK9NS (Jim Smith) informed me in a phone conversation that all was fine for the A5 (Bhutan) operation in about six weeks, but he is hoping that he can make S2 (Bangaladesh) sometime in the near future before the A5 operation. We will keep in touch.

PJ4V is Saba Island and counts as Saint Maarten.

LQ19DX is a special call for the Argentinian DX Group.

ZL0AIC is in Antarctica.

Lord Howe Island: Well, from reports received, all of which mention SSB and CW, it seems that there will be no RTTY operation. I have tried to contact VK3OT with no success.

XW8KPL states that he will be on RTTY every Saturday and Sunday, but only on 15 meters.

GL DE DX1 (VK2SG) via TG9VT.

Did anyone notice the new allocation for low power transmitters
under Part 15 at 13.553 to 13.567 MHz? It is mentioned on page
7 of the March issue of Monitoring Times.

What did the FCC have in mind with this allocation?

Here in Saskatchewan while the provincal ham organization died and most amateurs were fast asleep, our "Devine" goverment changed our ham plates to "vanity plates". We now rate the same as anyone else who wants a personalized plate - pay your $75.00 - you can have anything on your plate. Not hard to see how much our government appreciated our help during emergencies etc.

>remember 300 Mhz split.

I hate to sound like a legal eagle, but what you just described *is* a
repeater, and really shouldn't be in the simplex part of the band. I guess
low power, 1/4 mile range would be ok, but I think things would get
out of hand quickly. (IE: in some areas, there would be one of these on
each simplex "pair". saves the expense of getting a duplexer, also!)

As I understand the intent of the bandplan, repeaters are intentionally excluded
so there will always be freqs for mobile to mobile, etc. I also feel, personally
that high site remote bases should not be parked on simplex freqs with xmit
enabled for the same reason. Leaving rx enabled is fine.

With the cross band *remote base* (not repeater, as the ads say) capability of
the newer radios, It is even more important. Otherwise, some rptr operator
gets a call from an irate simplex user (or, worse freq. coordinator) wanting
to know why his repeater is on a simplex freq. When the smoke clears, they
figure out that some new kenwood/yaesu/icom owner is leaving his dual band
parked in remote base mode. (Usually using his 2mtr handheld to hit a 440
repeater from his house)

This happens regularly in our area. Sometimes even worse scenarios occur,
like when the new radio owner sets his radio for 2 rptrs, rather than
1 rptr & a simplex freq. Instant ping pong once one of the rptr's is kerchunked.

anyway, that's my $47 worth. neat idea though!

I just picked up a used Yaesu FT-2700RH dual band 2m/70cm rig at a hamfest. It appears that the previous owner has already opened up the coverage from what the manual says. I am interested in details of this mod and any other enhancements for this rig. Thanks and 73.

1594. Yaesu 757 vs 757GXII

Newsgroup: rec.ham-radio
Date: 1990-03-12 14:44:51 UTC
From: pescatore_jt%ncsd.dnet@GTE.COM
Message-ID: <9003121444.AA23182@bunny.gte.com>
Source record: 12899

About four years ago I bought a Yaesu FT 757 after playing with it, the Kenwood TS 440, and whatever the equivalent ICOM 12V all band receiver HF transceive was. I bought the 757 because it was cheaper, I liked the way it operated, and because it sounded better than the other two. I did a lot of playing with the choices at EEB.

When the radio worked, it was a great radio. In less than two years it died three times: one switching diode went, and the final xsistors blew twice. Ironically, after picking it up from EEB after the third repair, it was stolen from my car.

I have spoken to several local guys who had reliability problems with the 757 and several on the air.

According to the repair tech at EEB, Yaesu came out with the GXII in part to solve some of those problems. The GXII also has a notch filter and a "soft" mode switch, so you can store mode in memory with the frequency. No more hvinf to switch from CW when you want to check WWV.

I'm not sure I would buy a 757 again, but if I did it would definitely be the GXII. One reliable indicator is the relative value of the TS 440 and the FT 757 seen at hamfests. Equivalently aged 757s are selling for $2-300 less than 440s here. The integral antenna tuner represents only a part of that, I think.

I had similar troubles, and worse, with mine.

I resorted to cutting some sections in order to get it to
resonate. Mine is ground mounted with 3 radials covering only
90 degrees, since it is in the corner of my yard.

I had an intermittant resonance problem on 80&40 which turned out
to be either a bad connection between the trap coil and terminal
or dirt in the trap "capacitor", because after runnning full power
into it on 80 for a while - it got zapped, and now works! ;-}

Your mixer works! The fact that you have low oscillator injection
voltage only affects its conversion GAIN. You might try an auto-
transformer or ferrite broadband transformer to step up the
voltage, but depending on the particular application you may
just leave it alone.

There is a good new ARRL publication about transmission line transformers (in fact, I think that the title is "Transmission Line Transformers", but I don't have it here). I suspect your question is about an RF transformer, not 60Hz power supply transformer, so forgive me if I'm off base. This book discusses toroidal transformers and baluns, as well as other kinds. Probably for best results at most RF (up to VHF) toroidal transformer is most efficient and is "self shielding". Amidon, Palomar, Ferritronics, and many others make these toroidal forms. See also ARRL Handbook for design info. Choice of form composition and size depend on both frequency of interest and power level. Good Luck, 73. de WD5IBS.

1599. CW, RTTY decoder question

Newsgroup: rec.ham-radio
Date: 1990-03-12 17:04:53 UTC
From: elliott@optilink.UUCP
Message-ID: <3243@optilink.UUCP>
Source record: 12904

I am trying to find out what products exist that demodulate and decode morse code and rtty.

I am working the design of some at home, and while I don't mind re-inventing the wheel in this case (I seem to use CW generators and decoders as a mechanism for learning programming languages and hardware interface), it seems that my latest almost-finished product may fit in some currently unfilled market niche.

Products I am aware of, so don't bother to tell me unless you really want to:
1) The various packet-radio TNCs
2) The CW/RTTY decoder in April 1990 _Radio_Electronics_
3) A cute $180 (or so) decoder with LCD display, advertised in QST and elsewhere

Things I have seen allusions to, so more info would be appreciated:
1) Some packages for (Atari?) computers

My current design has the following features:
1) Small, fits in DB-25 shell (uses surface-mount)
2) Audio input jack (not really a feature, just a requirement)
3) Connects to IBM-PC / clone serial port, port-powered
4) IBM / clone _only_ (uses PC-specific programming)
5) CW only, but this is negotiable. RTTY a different unit for now
6) Adaptave filtering speed and weighting tracking in software
7) Transcript logging to disk
8) Morse generator output for free (rs-232 levels out on jack)
9) *Low Cost* ($49.95 target price)

Any comments on the above? This is not an offer to sell a product, but if you *would* buy one of these, or something similar I would like to hear why (or why not). Should I even consider trying to sell this?

Please Email me, all news feeds to Optilink are currently very flaky.

Thanks for your comments,
-- Paul Elliott, WB6CXC

1600. Call for discussion - rec.arts.tv.catv

Newsgroup: rec.ham-radio
Date: 1990-03-12 19:52:53 UTC
From: mrapple@quack.UUCP
Message-ID: <5188@quack.UUCP>
Source record: 12905
Cross-posted to: news.groups,rec.arts.tv,rec.ham-radio,rec.radio.shortwave

[crossposted to ham-radio because of possibility of technical
discussions, to radio.shortwave because of possibility of including
satelite programming, a distant relative to shortwave listening]

I would like to open a discussion period on the possible formation
of rec.arts.tv.catv, a group for the discussion of issues pertaining
to cable TV. Possible issues include regulation, programming,
quality of service and technical issues.

This group would be beneficial in that it would allow non-catv
readers to focus on broadcast issues in r.a.tv. It would also
allow discussions of non-programming topics not well suited
to r.a.tv.

The proposed group is not moderated.

Optionally this group may also include satelite broadcasting,
although that is not really cable TV. If they are, perhaps the
name should be changed.

This, of course, is not a call for votes. Discussions should
take place in news.groups to determine a proposed charter.
This discussion should end on April 1. At that time it should
be taken to e-mail or a call for votes.

If I've left anything out, I appologise in advance.

One program that we(the local Amateur Auxiliary) are putting on
for anyone that is interested is a combo program where we talk
about the Amateur Auxiliary(OO's) and also talk about DF techniques.
The DFing part seems to be a real popular topic. The meetings
seem to run a bit long because there are usually so many
questions.

Try contacting your local OO Co-ordinator(get his name from your
ARRL Section Manager) and maybe he can help you find a
speaker.

*** from Barry Fowler WB6JZL <barry@hprmokg.hp.com>

Simple antenna design (rules of thumb). Specifically, space-saving
antennae since many live in tract houses.

Maybe a t-hunt after the meeting to get the lard butts going.

Pictorials of the "evolution of commercial (and homebrew)"
amateur radio rigs.

Maybe a family oriented ham radio campout (something besides
ham radio to keep the rest going and not make it as intense as
Field Day). Maybe at a nice lake in the summer.

"The world's most simplest xmtr/rcvr and have them come to the
next club meeting and compare results".

*** from John Covington WN4BBJ cs00jmc@unccvax.uncc.edu
1. Presentation on proper method of traffic handling
(we had a local ham do this once; it was very helpful and
interesting since with packet many people are now trying to
handle traffic that have never bothered with it before)

2. History of Radio Communication
(a local radio history buff put on a good presentation about the
early days of amateur and broadcast radio)

3. DXpedition/special event slide shows:
(we have had slide shows of St. Maarten dxpedition; a trip to
Dayton hamvention, etc.; it gets those who haven't participated in
the past a "feel" for how much fun it is)

4. National Weather Service representative:
(we have a very active SkyWarn group around here; the NWS is
much in favor of us and glad to help out. He brought some
videotapes of tornadoes taken from a helicopter 0.5 miles away;
combined with his discussion of weather phenomena and tracking
techniques made for a very interesting meeting).

5. Packet Radio
(you may already have heard this one; but any kind of
specialized communications technique makes for an interesting
show if you get someone enthusiastic to do the presentation)

The selection of an enthusiastic speaker can be just as important
as the topic. Picking someone who really enjoys what they do will
usually give you the best program -- the speaker enjoys the
subject, gets an ego boost for being asked to do the program, tries
to convey to everyone else how much fun (or important if not
necessarily a fun topic) it is, and helps to broaden the horizons of
the attendees. Ham Radio is a learning hobby and anything you
can do to boost the interests of club members will make for a
better club. Some clubs don't have programs (or very good ones)
and end up becoming political bitching societies.

*** from Steve Harding -- KA6ETB @ N6LDL.#NOCAL.CA.USA -
steveh@atherton.com

Consider emergency preparedness. What to do if the big [your
favorite disaster here] hits.

How to handle NTS traffic, both via packet and on your local and
section nets.

1604. Incentive Licensing...and the League....

Newsgroup: rec.ham-radio
Date: 1990-03-12 23:11:20 UTC
From: dube@cpdvax.csc.ti.com
Message-ID: <9003122341.AA05084@ti.com>
Source record: 12909

Gary Coffman presented some good stats regarding the growth and decline of new Amateur licensees since 1968. These are interesting figures, but I would hesitate to attribute them to incentive licensing. NEW amateurs are hardly affected by I.L., since they generally start at Novice. There are some other reasons that bear directly on the variations in new licenses, among which are:
(1) Perceived cost to get on the air. If a prospective new ham is given the notion that (s)he has to purchase a $500 radio, a $100 antenna, a $150 tuner, a $200 TNC, and a $1000 computer (s)he will probably think twice or three times before going for it, and may be scared off by the economics.
(2) Recreation options. There are more options available now than there were 20 years ago. One such option is computers. A person can buy a computer, join a computer club and have lots of fun---all without having to pass any tests org getting any license from the government.

getting any license from the government!
(3) Observing Hams. I'm sure that a lot of people have been turned off by what they hear today on the bands, in publications, and BBSs. Inexpensive scanners, for instance, let prospective Hams listen in on our hobby in far greater numbers than they did 20 years ago.

I got my Novice ticket during the "1946 to 1968" period Gary mentions. My first station was about as cheap as you could get: an S-38C, a homebrew two-tube crystal-controlled transmitter, and a TV twin-lead doublet antenna. I wasn't a Ham when the NEW incentive license classes were added. Why do I emphasize "new"? Because there was incentive licensing then! My Novice was good for (I think) one year, after which I had to upgrade to General or get out of the hobby! (I got out). I can certainly sympathize with Gary and others who weren't "grandfathered" the privileges they held before the NEW incentive license classes were added. I would have been one of them. But it has little to do with whether an individual choses to become a Ham today. Gary closes by citing the very reason why I think I.L. works: "The advent of packet and satellites finally caused me to grit my teeth and up-grade". I applaud Gary for that! It is the stuff of which better Hams are made! So, you see, there really is only one class of license: Amateur Radio Operator. A Novice is a Ham just like the Extra; (s)he just doesn't have all the privileges yet.

73,
Dube Todd, N5PDK

Wouldn't "rec.tv.cable" give a clearer indication of what the group was about?
Most of the 'rec.arts.tv' series tend to discuss program content, and I would
imagine that the kind of group that is being proposed here would be for
technical bits and bobs.
Just a thought anyway!

Chris.

Hello all you Motorola aficionados out there !

In my opinion, with all the features built into the Japanese
HT's these days,unfortunately we still have to treat them too
delicately to enjoy them as much as we ought to.

I'll be looking around this year at Dayton for Saber III's,
Motorola's gem of an HT. (upgrading my MT-500)
A few of these were around last year at Dayton and were
being sold at 700-900 dollars. I hope the price drops this year
like they already did on the once-so-pricey MX's.
If anyone has any comments on the subject and/or has info.
concerning availability at Dayton please contact me via
my return-path address. (Not via the Info-Hams address please).

: and get the same effect. We can ALSO promote VHF/UHF MORE and HF LESS.
:
: Compromise is the name of the game.
:

I have to agree that the current hierachy doesn't address today's
technology. It seems very sad, however, that reform is inhibited, not
by the lack of good ideas, but by the FCC's computer.

However, this is probably the best opportunity we have to change the
system. If we don't respond now to the FCC with new and creative
ideas (even within the limitation of their computer), we will have no
one to blame but ourselves as new technology outpaces a very archaic
system.

1616. HF verticals (summary)

Newsgroup: rec.ham-radio
Date: 1990-03-13 18:28:42 UTC
From: lyndon@cs.AthabascaU.CA
Message-ID: <1762@aurora.AthabascaU.CA>
Source record: 12921

Thanks to all for the responses to my posting about HF verticals.
The hands down winner seems to be the Butternut HF6V, especially
for roof mounted applications. Although it's a bit narrow banded
on 40 and 80 (what vertical isn't?), it seems to show good SWR
across the remaining bands (30-10). Butternut provides an add on
kit for the WARC bands, as well as what seems to be a reasonably
good radial kit.

There were a couple of comments about it handling significant ice
loads with little difficults. This is important when you live at
51 degrees north :-)

A couple of people mentioned the Cushcraft AP8. From the people
I've talked to, this antenna works well if you mount it on the
ground with radials, but is almost hopeless when roof mounted.
(When I called the local ham dealer, he refused to sell one to me
when he found out where I was going to put it!)

Another response mentioned the August and December 1983 issues
of CQ which contain articles on how to build a (legal) clone of
the AV-25.

Out of the nine replies I received, six were for the HF6V. Since
I was biased towards this one to begin with, guess what's going
on the roof :-)

Thanks (in no particular order) to the following people for
giving me their thoughts on this:

Bill Meahan (WA8TZG), Tad Cook (KT7H), Mark (VE6MGS), Goh Kawai (N6UOK),
Mike Edelman (KE8YY), Chris Kelly (WD5IBS), Mike Harris (KM4UL),
haynes@ucscc.ucsc.edu, George La Belle (WB6YZZ).

I'll let you all know in a couple of weeks how this works out.
(See you Saturday on 10 :-)

There have been a lot of postings to the effect of "we need {the no-code license | the elimination of incentive licensing | your favorite cure-all} because all the hams are dying out, there are too few new ones, and we'll lose everything if we don't."

Yet, the following statement has appeared a couple times, and no one has complained about it or refuted it:

: In order to not get foreign hams mad at us, we probably do need to keep some
: band segments relatively clear of the intense density of US hams.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

You can't have it both ways, folks.

Either there are too few hams, which means that we cannot have an "intense density of US hams", or we already have too many, in which case you want *more* arbitrary filters to reduce the candidates and fewer applicants.

1618. Weather Fax. HELP!!!!!

Newsgroup: rec.ham-radio
Date: 1990-03-13 19:50:27 UTC
From: lawrence@smcnet.UUCP
Message-ID: <710@smcnet.UUCP>
Source record: 12923
Cross-posted to: rec.ham-radio,rec.ham-radio.packet,rec.radio.shortwave

Our Earth Science Department purchased a Kenwood R-2000 HF receiver and an AldenElectronics 9321 Weather Chart Recorder for reception of radio fax weather pictures. Being the resident ham on the staff of the college they assumed that I would know how to hook the gear up. Unfortunately I have not had much experience with HF yet. I have set up a long wire antenna and can hear some sort of data trasmission on the freqs. that came with the Alden docs. Nonetheless we have never seen anything printed in the fax machine except black lines.

The questions:

-- Is there a better way to receive weather pictures with different gear? Is there a TNC and PC setup that might work better than the paper based fax unit?

-- What should the receiver bet set on? (AM, USB, LSB, CW)

-- Is a long wire good enough or do we need a beam or something?

Any assistance or help would be greatly appreciated. Earth Science won't let me walk down their hall until I get this thing working.

What you are hearing is a CHIRPSOUNDER. This is a highly sophisticated device used by the military for plotting real time ionospheric conditions, for the determination of MUF and LUF. These devices (there are several of them) operate in the manner described, sweeping from about 3khz to 30khz at a uniform rate, and a transmitter and receiver plot the spectrum characteristics over a number of global paths, and the display (so I have been told) is a very beautiful on screen representation of the current condition of the entire radio spectrum. Too bad this info is not available to the general public (Oh if only I could provide this on our system here!)... BUT it is a pretty hush hush deal.

There are other noises you will hear in ham bands and elsewhere that first appear to be random, but are actually military in origin (Spread spectrum, etc). There are digital "buzzes" which are used with radio navigation, and these can pop up anywhere, EVEN IN THE HAM BANDS. There is also a very strange sound that I call a "Pock-a-pock" which sounds sort of like someone hitting a microphone with a pencil, but upon careful listening the seemingly random patterns are repeated (I noticed this by accident while playing a recording while simultaneously receiving the signal again live, and found that the pattern was repeated) In addition to hearing these sounds regularly for YEARS on my nightly operating frequency of 3950khz, they also show up on MILITARY channels like 6761, and you can bet your binaries that if this was some sort of pirate activity, it would not have lasted long THERE. These sounds have been around for YEARS. The fact that they are seemingly random leads operators to believe that they are local in origin, but in reality they are heard almost world wide.

There is also an obnoxious signal on 3922 in the 75m band, which reportedly originates in CUBA. It is hand keyed gibberish CW, and it splatters all up the band. It has wiped out communication on 3950,

where a "negative spur" shows up during the transmissions. (When the transmitter is UNKEYED, it puts this terrible NOISE on 3950).

I wonder whatever happened to INTRUDER WATCH. Of course, if your own government is responsible for the interference, I guess they have first "dibs" on the spectrum, eh?

Lots of strange signals out there in the wee hours. Join us on 3950 some morning around 1 or 2am and listen, you will hear this stuff. I imagine it shows up elsewhere as well....

1620. TS-790 Sat feature

Newsgroup: rec.ham-radio
Date: 1990-03-13 23:04:41 UTC
From: s36572u@puukko.hut.fi
Message-ID: <1990Mar13.230441.478@santra.uucp>
Source record: 12925

Does anyone know a a better way to use the sat feature on the Kenwood ts-790 than to constantly press the sat button, when you want to change the sub rx frequency to the corresponding uplink on the main. I really was hoping that the sat function would do the inverse of what the function 'trace' does, in other words, it would simultaneously change the sub frequency, when you rotate the main vfo knob. Can this be done? In my opinion, the info on this point in the manual is inadequate.

Message-ID: <1990Mar13.233352.471@heights.cit.cornell.edu>
Source record: 12827

Does anyone have instructions on how to modify an Icom 2GAT so that it can transmit out of the ham bands. I work for my campus police department and have had several occasions where it would have been convenient to be able to contact them without the trouble of having to first find a 10-21(landline). If anyone has sucessfully completed this Mod, I'd appreciate it if they could send me some instructions on how to do it.

The freq's I'd need are in the 155-157 MHz range.

NOTE:: I don't have my license yet, though I recently passed my tests through technician. If nothing else, this will give me something to do with my radio until I can use it on 144-148.

I disagree with the concept of making privileges a reward. This makes it
something like a prize.

The exams SHOULD measure how capable we are of NOT abusing the privileges
that we want to have.

Prizes are offered for doing things that may in fact NOT be related to the
nature of the prize. We should not be doing this in ham radio. VHF/UHF
privileges are unrelated to Morse Code for most people.

(Any email enquiries, I guess, should come through me)

alan.

The Newcastle Brick Award

Newcastle Earthquake Appeal

Amateurs Helping Rebuild Newcastle

In conjuction with the Australian Broadcasting
Corporation's Radiothon for the Newcastle Earthquake Appeal,
members of Newcastle's Amateur Emergency team, called WICEN,
will be broadcasting for 22 hours from 1400 UTC on Saturday
March 17, until 1200 UTC on Sunday March 18, on the follow-
ing bands as conditions permit.

3.610 MHz
7.090 MHz
10.130 MHz
14.280 MHz
21.190 MHz
21.280 MHz
28.510 MHz

There will be 3 awards for contacting the station.

Basic Brick AUS$3
Big Brick AUS$5
Super Brick AUS$10

Help Newcastle amateurs dispose of bricks to help
rebuild Newcastle. A magnificent award created in honor of
this occasion. And, in honour of this occasion, a special
callsign, VK2EQA, has been allocated for the period.

All mail including QSL cards and payment should be
addressed to:

1627. ACC's RC-50 repeater controller; Bugs, Mods, support, and/or info

Newsgroup: rec.ham-radio
Date: 1990-03-14 07:16:08 UTC
From: mikey@pnet01.cts.com
Message-ID: <1829@crash.cts.com>
Source record: 12832

I am sysop on a 220 Mhz repeater in San Diego County. We have had the Advanced Computer Control's RC-850 repeater controller online since 1987. I'm looking for anyone with experience with the same controller. I have found numerous bugs with the firmware and would like to discuss mutual problems.

We started with firmware version 3.41 and upgraded to 3.42 as soon as it was released. The revision was nice in many respects but somewhat clunky in others. We are runnings the 850 with the voice option, no DVR, UF functions in latched, 3 remote bases, control receiver, home-brew autopatch at the site and 1 remote auto-patch using firmware support of REMOTE PHONE 1.
Overall, we have been very pleased with system even with some of it's short-commings. I have talked to ACC by phone a few times about the clunker bugs, but they were'nt to concerned by them and, I doubt, that they even logged them for fixes in later releases.

I would now be interested in a MS-DOS based controller with voice support. Anybody want to comment on this aspect of computer-controlled Ham repeaters.

Thanks, 73's

...Mike

ps--this is a repost in case ya missed it or did'nt think it mattered the first time around. Thanks, ...Mike

> low power, 1/4 mile range would be ok, but I think things would get
> out of hand quickly. (IE: in some areas, there would be one of these on
> each simplex "pair". saves the expense of getting a duplexer, also!)

I am sounding like a legal eagle, too, by sticking to my position and asking
you to show how it is that what I described is a repeater. I see nothing in
it to indicate it is a repeater. The received audio is not (significantly)
repeated in the transmission due to an isolation bridge in the actual phone
connection. Some will leak through, but it would be quite low.

> As I understand the intent of the bandplan, repeaters are intentionally excluded
> so there will always be freqs for mobile to mobile, etc. I also feel, personally
> that high site remote bases should not be parked on simplex freqs with xmit
> enabled for the same reason. Leaving rx enabled is fine.

As long as your argument is based on your believing that my idea is a repeater
then I can only consider it a moot argument.

There may be arguments for not putting a non-repeater autopatch on simplex
frequencies, but repeater frequencies are also NOT the place for it. Think
it through again and see what you come up with. Maybe we need to redo all
the bandplans to accomodate new things. That means reducing the number of
frequencies usable by repeaters, of course.

> With the cross band *remote base* (not repeater, as the ads say) capability of
> the newer radios, It is even more important. Otherwise, some rptr operator
> gets a call from an irate simplex user (or, worse freq. coordinator) wanting
> to know why his repeater is on a simplex freq. When the smoke clears, they
> figure out that some new kenwood/yaesu/icom owner is leaving his dual band
> parked in remote base mode. (Usually using his 2mtr handheld to hit a 440
> repeater from his house)

First of all, why is it that the simplex user or the coordinator didn't copy
the call sign of the guy operating the crossband repeater? If he did have it
identifying, then it should be copied and that tells you what is going on.
If he did NOT have it identifying, then it is illegal, period.

Some are simplex and some are duplex. The duplex ones can be easy set up to cross a repeater pair from one band into a repeater pair on another. This reduces the problem somewhat. It would be nice if these radios had separate power level selection on each band.

It would be prudent to use CTCSS in these cases. In fact I intend to do so for my crossband autopatch. I also believe ALL repeaters should be REQUIRED to use CTCSS.

> This happens regularly in our area. Sometimes even worse scenarios occur,
> like when the new radio owner sets his radio for 2 rptrs, rather than
> 1 rptr & a simplex freq. Instant ping pong once one of the rptr's is kerchunked.

Are all these examples of people doing things wrong supposed to justify why people who would do things right should not? This same kind of reasoning can be used to eliminate ham radio altogether just because there are a bunch of lids on 20 meters.

> anyway, that's my $47 worth. neat idea though!

Well, I do plan to go through with it. If you can determine how it is not legal, I am interested in hearing it. If you can explain why it is a repeater even though it is not repeating anything, I'd like to hear that as well. Suggest a pair of frequencies for it (say, for your location).

> charges could be imbedding the price also. Any premium shipping methods could
> be surcharged. Gosh, I feel a little better now.

The best that I can determine is the
shipping charges are designed
to ensure that money is made even if
the customer returns the product.
By something for $100 with $15 Shipping, etc.
Money back guarantee.
Return it; get back $100.
Company has $15 for its effort.
Others may argue that $15 doesn't cover costs but it sure helps.

Many money back companies work that way.
I use the shipping % of price as a filter of who not to order from.

Source record: 12836

Well, this isn't really about digest V90 #277 but the computer gave me that subject.

What value capacitor would anyone recommend to be put accross my stereo's speaker terminals to stop humming caused by Xmting on 2m? I amagine that this would happen too (probably even worse) with HF. The RF gets into the stereo so bad that when transmitting at high power, it kicks in the stereo's protection circuits and turns off the speakers for a few seconds. Also what voltage? Stereo specs say max of 65W/ch.

Hmmm. (pun) Thanks!

I'm almost certain that the "pock-a-pock" noises you refer to are from
frequency hopping HF radios. I have also heard them for the last few
years -and with ever increasing frequency (Ha ha -no pun intended).
At the IEEE Milcom '88 Conference Hughes Radio had a demo booth with
some frequency hopping PRC-104A HF packsets. When you listened in on a
third non-hopping mode radio you heard only that familiar "pock" sound.

I would assume that the hopping can be spread over any portion of the
2-30 MHz range of the radio if it can switch fast enough. (Pin
diodes in the antenna tuner and half-octave filters?) Propagation
between stations would probably dictate a smaller chunk of spectrum
-possibly explaining the large number of "pocks" you can hear on a single
frequency.

If you (like myself not too long ago) think the Big 3 ham manufacturers
are the last word in HF technology then you should get a recent copy of
"Jane's Military Communications". There has been a big resurgence in
the popularity of HF for point to point communications in the past 10
years.(Even with satellites.) Every country with a decent section in Jane's
has hopping HF systems in service. Check your public library for Jane's.

>Does anybody have a recommendation for a qsl card
>maker?
>[. . .]

Well Jon, I made my own cards, and am quite pleased with the
results. I used a formatter (troff) to make a custom "back,"
as I work only QRP CW, so didn't need the standard "CW/SSB"
or "Power" choices. I took a bunch of B/W pictures of me
"out in the wild" with my QRP rig, and then went to a local
printer for advice and to get the cards printed. Cost for
1000+ cards, foto on one side, with call and QRP ARCI logo
in red, came to just over $100. The card almost always gets
comments, even if it is "You sure are ugly" :-)

I have been giving some thought to how an international dx contest can be designed so that anyone/anywhere has a chance to win with no regard to how much money you have or the type of QTH you have. The secret is in the rules (eg multiplier maybe a funtion of ERP ... perhaps a log function). In addition there would have to be some kind of multiplier that accounts for local propagation conditions (eg. if you live close to the artic circle you are subject to more severe propagation distubances than if you a

re near the equator). Perhaps beacons could be usedand a multiplier derived that is applied at the point of submission of contest logs.
I know that this is not a trivial design problem. I sure would like some feedback and ideas!

>7 of the March issue of Monitoring Times.

The frequency of 13.560 MHz +/- 7 KHz is already assigned by the FCC as an Industrial, Scientific and Medical Frequency. Things like diathermy machines, plasma generators, and dielectric heaters operate on these frequencies. Some other ISM frequencies are:
6.78 MHz +/- 15 KHz
27.12 MHz +/- 163 KHz
40.68 MHz +/- 20 KHz
915 MHz +/- 13 MHz
2450 MHz +/- 50 MHz (Home microwave ovens)
5800 MHz +/- 75 MHz
24125 MHz +/- 125 MHz
61.25 GHz +/- 250 MHz
122.50 GHz +/- 500 MHz
245.00 GHz +/- 1 GHz
Most ISM equipment operates at high power (I have two 20 KW units here that will be surplus soon) with unfiltered power supplies. A few low-power signals here probably wouldn't be noticed. Count on the low power stuff to have to accept the interference.

Source record: 12842

>Robert,
>I would return the computer to the place of purchase ASAP. A class 'A'
>computing device is 10dB louder than a class 'B' device.

Not necessarily - a computing device which says that it is "class A" simply means that it (more precisely, samples of this model) has been tested and certified to pass the FCC requirements for a class A device. It may actually be significantly quieter than another device labelled "class B" but was for various reasons not tested to that standard. (Class A is, in general, a looser requirement than class B, but there are other considerations taken into account by manufacturers when they choose which class to certify to.)

Even Class B devices may cause annoying interference, if they happen to generate RFI at a particular frequency of interest to you - as may be the case here. Also, not all interference comes over the power lines, so it's not too suprising that adding a line filter didn't help. (Actually, given that it's relatively simple to keep VHF frequencies off the power cord, I would've been surprised if conducted interference had been the culprit here.) You are more likely seeing interference radiated from the system. Some possible means of reducing interference in any event:

1. Make sure the computer is on a different power line than the unit being interfered with (primarily useful in the case of conducted interference).

2. Make sure that the computer's case is assembled correctly, that all screws are in place, and that the proper cables and connectors are being used. (One very common source of interference is from the system cables, esp. when the connectors being used do not provide the proper ground/return path.)

3. If you suspect that any of the peripheral devices are causing a problem, disconnect their interface cables one at a time to isolate the problem. If you can isolate the faulty unit or cable, half the battle's over.

4. If you have opened the computer's case to install optional cards, etc., make sure that such cards are properly installed and that all grounding screws, etc., are in place. (And then, see item #2!)

5. The monitor is a likely suspect in computer interference problems; check to see if your problem comes from the video by disconnecting/re-connecting the video cables, and turning the brightness up and down, while noting the effect on the interference.

6. Finally, noise can escape to the outside world through slots and other openings in the computer's case. Ideally, all digital electronics would be sealed up inside of completely closed metal boxes, but the need for cooling and connectors makes this difficult. However, if you can do so without comprising the unit's cooling or electrical safety, closing up

opening with something conductive - copper tape is the most common solution - can be helpful. Slots between interface cards is one common area of leakage. NOTE: DO NOT do ANYTHING to your machine unless you're CERTAIN that you can do it without compromising cooling or safety. Also, be careful of damaging your *warranty* through any such mods.

SuperMorse is the evolutionary product of CW111 and CW102. Lee Murrah wrote both of the programs and they are excellent for code practice on the PC. The latest version of supermorse (SM309.*) will also allow you to connect to another person via modem and practice CW with each other.

All in all a VERY good package. I have it available on my BBS at 317 882 9330, just login as Ham Radio with a password of yagi. This will allow people to download on their first call to the system.

From: jimkirk@OUTLAW.UWYO.EDU
Message-ID: <900314135856.20201ebe@UWYO.BITNET>
Source record: 12844

I just had a very strange thing happen with my PRO-2004 scanner, and was wondering if anybody has an explanation. I was attempting to re-program several frequencies, but in certain ranges it would add 3.2768 mHz to the frequency I keyed in! For example, I would key in 160.0 but as soon as I press ENTER it would change to 163.2768 (the last digit was smaller than the rest). Likewise 154.31 would change to 157.5868. After fiddling with it for a while to determine the range(s) effected, I noticed they would "narrow" after repeated attempts, and after about 30 minutes of fiddling, the scanner finally accepted the frequencies as I input them. I tried power off/on and reset to no (immediate) avail. It acted as though it forgot how to be programmed after many idle months!

Has anybody else had similar experiences? Any thoughts? What's magic about 3.2768 mHz?

My Webster's defines privilege as "a right or benefit granted as a peculiar advantage or favor". Phil may not agree with the concept, but until the meaning of the word changes, I guess we'll all have to live with it, or quit calling our amateur activities privileges and call them something else.
In my opinion, I think "privileges", as defined by the dictionary, fits the situation perfectly.

You sounds like one of those "HF bigot OF's". I hope this isn't true.

The assumption you made is an assumption a lot of hams are making which is what is making this whole process so difficult. Lots of hams are so wrapped up in HF hamming that they forget that there are bands above 10 meters and they don't realize this it is THESE bands that are the issue in the "no-code" matter.

NO, we do NOT want more hams on the HF bands. The HF bands are TOO CROWDED as it is. We do not face significant threat of loss of HF bands due to lack of use. 40 meters appears to be facing some threat from broadcasters, but that is a different issue.

What we DO WANT is more hams on VHF and UHF and SHF bands, most particularly on UHF and SHF. These bands are the threatened ones.

Whether I.L. has failed or succeeded is UNIMPORTANT. It merely stands in the way when combined with FCC computer limits, of implementing a workable licensing structure for making access to VHF/UHF/SHF based on the actually needed competency.

If you can reduce the number of classes with HF privileges to FOUR, then the problem can be dealt with. Try it and see what you come up with.

> >The exams SHOULD measure how capable we are of NOT abusing the privileges
> >that we want to have.
>
> What sort of exam is able to do this?
>
> Steve Dakin WQ5N

MY IDEA of a ham exam is not too far from what we have now, except in its level of comprehensiveness.

The REGULATIONS exam SHOULD be an "open book" exam, since what we really should be pushing is the ability to look up and understand the rules, not memorize them. The questions, and there need to be more of them, ask questions generally requiring the lookup of most of the rules. The VEC's are NOT to provide a copy of the rules, so if you don't own a copy yourself, then you memorize anyway, or fail that section. I recommend 40 to 80 questions for this section.

The THEORY should cover the electronics and radio knowledge necessary to understand what radio is, how radio waves are made, propogated, modulated, amplified, etc. There should be many questions on how various kinds of interference to other communcaitions, amateur and non-amateur, can occur. The lower theory exams should cover the basics of RFI prevention and cure. The upper theory exams should cover things more comprehensively, including these aspects of the design of radio transmitters. Any aspect of radio or electronic theory, which if not known would NOT result in interference to any service or result in a hazard to life or property, does not need to be in the exam. Safety for oneself and others must be in the exam, of course.

As you can see, it is not too much different than it is now. I would put more emphasis on things like RFI and Safety and not so much on propogation.

Amateur privileges should be granted to those who can prove they are capable of their proper use, and be retained by those who practice their proper use. Amateur privileges should NOT be a reward for any "song and dance" such as proving that one can copy Morse Code to get privileges unrelated to it.

We should generate the tests by computer. For each question on the exam, there should be a set of a few algorithms that can generate an applicable question. An algorithm would be chosen at random by the computer, and then the actual values for questions requiring computation, would be chosen at random from a large set of reasonable values. The same algorithm should also choose alternate false answers of different varieties. The pool of algorithms should be public, but would potentially result in millions of possible questions, certain of the computational ones. It is necessary to publish the algorithms for assurance of the correctness of the exam. No

one could blindly memorize the answers because there are so many possibilities. Short term memorization of the actual facts and formulas is still possible, but that can be addressed by there being more questions on the exam and thus covering more things.

The passing grade should be 80% on BOTH the regulation AND theory exams parts.

Here is another idea. We could use ONE exam for two or more levels of classes and base the class on the level of passage. For instance a single exam would earn a lower level license if it was passed by 75% and earn a higher level license if it was passed by 90%. One should have to pass BOTH the regulation and theory exams by 90% to earn that level.

Well...
I think that the exams should have a lot more on good operating
practices and a lot less on widely varied technology. When we run
the hurricane watch net, our biggest problem isn't that someones
rig has a technical glitch - it's that the computer between some
of the operators' ears is defective. At least these people would
have had to memorize some questions such as:

3A:
You live in Michigan are curious about a hurricane about to hit
Florida. There is a Hurricane net operating on 14.325 forwarding
weather and damage reports between the affected area and the National
Hurricane Center. You should:
(1) Say "break break break" and then ask for the latest hurricane
coordinates.
(2) Wait for the net control to ask for "any stations in the affected
area with weather reports" and then give your call and ask your
question.
(3) Wait for net control to ask for "emergency or priority traffic"
and then ask.
(4) Disconnect your microphone and listen until you hear the
information that you need.

3B:
A massive flood has hit Phoenix, AZ. Your next door neighbor has
a favorite nephew somewhere in Arizona and is terribly worried. You
should:
(1) Find an emergency net, break in, and ask about your neighbor's
nephew.
(2) Find a health and welfare net, break in, and ask about your neighbor's
nephew.
(3) Find a ham who regularly handles this sort of traffic, and give it
to him.
(4) Listen to health and welfare nets, wait for them to ask for anyone
with traffic for the area, and then give it to him.

3C:
You are listening to a net and someone is jamming it. You should:

(1) Join them in the jamming;
(2) Wait until they stop, and then say "What a LID"
(3) Call the FCC and demand that they stop the jamming.
(4) Ignore the jammer.

I would sure like to see a bunch of questions like this in the question pool!

Will you lighten up? You've been a real crosspatch lately. The 21 mtr frequency
was probably an old ISM allocation. I don't remember what it was used for, but
I vaguely recall some reference to that in the NPRM when Par 15 was being
restructured. Leaky cable proximity detectors, maybe.

> will find out anyway, and that goes for learning code as well.

As such, I propose that the written exam be divided distinctly into a THEORY exam and REGULATION exam. The REGULATION exam should be given in OPEN BOOK style, using tough questions that require you to look things up. Because most people forget details and trivia anyway, it is better for us to stress the skill of reading the rules instead of memorizing them. In addition we need to also stress the idea of owning a copy of the rules. The VEC's will NOT provide a copy of the rules; you bring your own to the exam. You get to use ONE book or pamphlet during the REGULATION exam.

Perhaps we should ask how many tiers of HF privileges other countries have.

Regional band planning is already going for the larger areas now, especially in California.

No, do not post.

If you have FTP access, check out the database on:
hamster.business.uwo.ca (IP 129.100.22.100)

If you do not have FTP access, ask for someone to mail you a copy
of what you are interested in.

Source record: 12855

Is there a way I can get a message to a particular BBS VIA Info-Hams
AUTOMATICALLY ??
Packet on 20 and 15 meters these days seems to take forever from here but once
in the States - it seems like the messages zip right along.

Please answer via E-Mail (return address) and not via Info-hams.

Maybe the original poster meant that American amateurs aren't very clever compared to foreign ops? That's one reading of the phrase "intense density". I could understand it too, considering some of the blather I've heard on 20 metres lately.

NOTE TO THE HUMOURLESS : THIS IS A TONGUE-IN-CHEEK POSTING. I DON'T EXPECT FLAMES ABOUT A JOKE. TAKE A DEEP BREATH AND RELAX. THANKS.

>3. DXpedition/special event slide shows:

Looks like the perfect opening for me to remind everyone about the
free slide shows available from the Northern California DX Foundation.
To wit:

(last updated 3/15/90)

The Northern California DX Foundation has for loan a number of
DX-oriented slide shows. Each program consists of one or two slide
trays plus an audio tape with narration, so they make a good ready-
to-use program for ham clubs. I'm not going to claim that they're
all professional-quality productions, but when was the last time a
network news crew offered to spend 10 days on Clipperton? :-)

The rental "fee" is cost of postage only (about $5 roundtrip in the US).
Library manager is Josephine (Jo) Clarke, WB6ZUC, 207 Evergreen Drive,
Kentfield, CA 94904. If you'd like to order a show, please send her the
name of your club, the date for which you need the slides, and more
than one choice of program in case your first choice isn't available
for that time. The shows are quite popular, so you should write at
least a couple of months in advance.

Here's the current list:

SLIDE SHOWS
1. Kingman Reef and Palmyra Island 1974
2. Africa (K5YY) 1978
3. Easter, Galapagos, San Andreas, etc. (W6KG, W6QL)
4. Kermadec (W6REC, ZL1AMO, etc.) 1984
5. Saipan AH0C, CQWW contest 1983
6. Clipperton Island FO0XX 1985
7. Ponape Island travelogue (N6HR)
8. Pribilof Islands 1982
9. Midway Island (NA6T, KD7P) 1985
10. Antarctica travelogue (WB6ZUC)
11. Pitcairn Island (ZL1AMO, ZL1ADI) 1979
12. Transpacific (SM0AGD) 1982
13. Burundi (ON5NT) 1985
14. Benin (ON5NT) 1981

15. Lord Howe Island VK3DXU/2 (K2UO)1985
16. Monaco (F6EYS, F6HIX) 1984
17. Uganda (DJ6SI) 1985
18. Market Reef (PA0GAM/OH0/OJ0) 1983
19. Marshall Islands KX6DS
20. Andorra (DL1HBT, DL3HAH, DL5BAD, DL4BBO, DL4BAH) 1986
21. Clipperton Island FO0XX 1986
22. Peter I Island 3Y1EE, 3Y2GV 1987
23. U.S. Virgin Islands KP2N CQWW CW contest 1986
24. Market Reef OF0MA 1987
25. Abu Ail A15AA (DJ6SI) 1988
26. Macau XX9CW (DK7PE) 1986
27. Palmyra (K9AJ, KP2A, WA2MOE, W0RLX, F6EXV, JA5DQH) 1988
28. Kingman Reef (same operators as above) 1988
29. Cocos Keeling Islands, Christmas Island, etc. (W7SW) 1988
30. Banaba Island T33JS 1989
31. Revilla Gigedo XF4L 1989

VHS VIDEOTAPES
1. XU1SS (plus BV0YL and BV0JA)
2. 7J1RL (includes ZK9ZR, Mellish Reef) 1976,78
3. VK9ZR (plus Ogasawara) 1978
4. Frankford Radio Club ARRL Phone contest parody (plus JH7YFL CQWW CW)
5. Okino Torishima JF1IST/7J1 1979
6. Australian travelogue: Climbing Big Ben; Heard Island
7. Ham Radio in the South Cook Islands (ZK1CA, ZK1CT)
8. Pitcairn Island (ZL1AMO, ZL1ADI) (copy of slide show listed above)
9. Looking Up in Rio Linda (W6GO, K6HHD antenna farm) 1986
10. Revilla Gigedo XF4DX 1987
11. Northern Texas Contest Club: Towers and Contesters
12. It Started with a Broken Fence (JH3DPB Tall Tower Tale)
13. Pile Up Busters (humorous)
14. St. Martin FG/W2QM/FS: DXing Senior Style
15. Laccadive Islands VU7WCY (plus VK0HI 1983 from TV) 1984
16. The K6UA Contest Station Story
17. Malpelo HK0TU (in Spanish) 1983
18. The Ship That Shouldn't Have (VK0JS Heard Island)
19. The New World of Amateur Radio (hosted by K6DUE) 1988
20. The Western Sahara Story S0RASD (Lynx Group) 1987
21. Auckland Island (ZL1AMO, ZL1BQD, N7NG) 1988
22. Owen Garriott Talk (about his ham/shuttle activities) 1984
23. Russian Ham Radio Tour (WA6WXD) 1986
24. Peter I 3Y DXpedition, 1987 (copy of slide show)
25. Peter I, from JA7ARW 1987
26. Spratly Island (K4SMX, K1MM, VK2BJL, etc.) 1979
27. Malyj Vysotskij Island (OH2BH, UZ3AU, etc.) 1988
28. 3W8DX and 3W8CW (HA5WA, HA5MY, HA5PP, HA5BBC) 1988
29. Aruba, P40V CQWW Contest 1988
30. A Message from Barry Goldwater [I think about no-code]
31. Navassa (N2EDF, K2SG, etc.) 1988

32. Rhodes, SV5, by N2OO and SV0AA 1989
33. Howland Island NO1Z/KH1 (NO1Z, 7J3AAB, etc.) 1988
34. BEARS at the Great Wall of China (W7EA, etc.) 1988
35. Kansas City DX Club DXpedition to Tonganoxie Island

From: RHAREL%FAB8@SC.INTEL.COM
Message-ID: <9003160819.AA16137@ucbvax.Berkeley.EDU>
Source record: 12858

Can anyone give me some feedback as to what speeds data transfer is
achieving these days over:
a. Conventional Telephone lines
b. Leased data lines
c. RF (mainly microwave)

Is anyone doing some experiments out there digitizing voice and then
transferring it at high speeds via RF ???
Maybe the day 'aint so far off when repeater clubs will have a microwave
dish at their site pointed at OSCAR 'XX' that will forward
voice messages at 56 mbyte per second.

73 de 4X1DA
Richard Harel

Feedback ???
Please direct responses to return E-Mail address.

Just that 2^15 = 32768.... Here's a wild guess but I'd say the 15th bit going between your keyboard and the PLL/Display circuitry was stuck as logic "1" causing you a bunch of grief. I don't have any clues/solutions other than reseating the connectors between the keyboard subassy and the rest of the radio. Never heard of this problem before.

While some companies may do this, DAK refunds both the cost and the
shipping charges if you return the product. You pay return shipping to
DAK, but that's always less than they charge you for some reason.

Source record: 12862

>| catv = community access television (not "cable tv")
>I think if you go back to ancient times, you will find that it stands
>for "community ANTENNA television".

Right. As opposed to "MATV" which is "Master-antenna television", when an apartment house or ^ other multiple-dwelling unit had their own antenna farm, distribution amps & splitters, and internal cabling to each unit.

In the industry, "catv" is now used to refer to cable tv generically. If you are buying broadband LAN cable and splitters, say, you look at "catv catalogs" for that stuff.

Anybody using the term to mean "community access" probably works in that activity, and such usage is limited in scope and would not be recognized in the general video industry. If THAT is what this proposed USENET newsgroup is to discuss, the name should be rec.arts.tv.community or something specific like that. (I thought of suggesting "rec.arts.tv.commun" but figured that would be interpreted as "communist tv"... :-)

Actually, I disagree with the whole concept of finer and yet finer distinctions and splitting topics up into more and more specific newsgroups. I believe that each newsgroup should have a rather broad charter, and each one be fully two-way gatewayed into an Internet mailing list, the way rec.video interacts with Videotech@wsmr-simtel20. All TV and video technically-oriented stuff should go into that list, and all content and programming-oriented stuff should go into a "rec.tv" or "rec.tvprog" which should have a corresponding mailing list for non-USENET participants. [I don't know what current tv newsgroups there are, not having USENET access myself currently.] Only with that approach can you maximize the number of participants and avoid losing information.

This approach helps avoid the possibility of newsgroup access being cut off by an organization as "non-work-related" (the academics out there don't consider this, but it is a very real consideration at non-school sites!), because it is easier to defend a group as having valuable content that just happens to also contain frivolous (and therefore enjoyable! :-) related postings. Broad-spectrum groups can get in when specific narrow-interest ones cannot. [Actually, "rec.video" should become "sci.video" under this approach, to get it into places that embargo the "rec" groups. Or maybe there should be a "tech" top-level heading for things that are sort of "engineering" -- not pure science but more technical than recreational.]

Anyone who is interested in one aspect of video technicalities, or in one aspect of TV programming or content, really should be at least

somewhat interested in all other aspects of that field, and, for their own good (<-- dangerous concept, this! :-), should be exposed to the whole range of topics in that field. The arguments for specific narrow-interest newsgroups thus are specious and should not be given weight. The entire idea of isolating topics and limiting that is inherent in the move to ever-more-specific newsgroups is wrong. It encourages narrow-mindedness, when the whole concept behind the net (in all its forms and extensions) is to *broaden* ones exposure and knowledge base. Too many times, I have seen complaints from people about "having to wade thru too many postings" on other subjects in order to get some specific topic or subject. This is NOT a valid complaint. It is a *benefit* for there to be a sea of knowledge out there that you dip into. Just because you cannot drink it all down is no reason to gripe about it being there!

Since I cannot post it over there, someone on USENET feel free to repost this whereever in the "news.xxx" groups the discussion is taking place. I hope the net.wizards out there will recognize the validity of this point of view and take steps to reduce or eliminate newsgroup subdivision, and, hopefully, do all they can to encourage the existence of gatewayed mailing lists for all groups, so as to insure participation is available to as many people as possible.

>>
>>Chris.
> In case nobody else has pointed this out:
> catv = community access television (not "cable tv")

Well, isn't that a strong argument against the name? It certainly isn't clear what catv is from looking at the name. I would suggest coming up with a different name (e.g. rec.arts.tv.community if the group is about community access TV and rec.arts.tv.cable if the group is about cable TV?).

Also, please don't limit your distribution unless the distribution of the group will also be limited. If it wasn't for the fact that we get articles with usa distribution passed on to us, we would have missed out on this discussion. Of course, if the topic is Cable TV, then it may be a good idea to limit distribution since it is so much different down there :-).

1659. TV and FM DXing

Newsgroup: rec.ham-radio
Date: 1990-03-15 16:18:47 UTC
From: price@MARLIN.NOSC.MIL
Message-ID: <9003151618.AA19401@marlin.nosc.mil>
Source record: 12864

Several people have asked me to elucidate a bit on this topic as a follow-on to my posting a couple of weeks ago.

What we're talking about here is relatively long-distance reception on commercial TV and FM frequencies at basically unpredictable times and from unpredictable places.

The mechanism is the ionosphere when the E-layer gets excessively ionized and causes skip not unlike the F-layer skips to which we are accustomed in ham radio and normal shortwave. Thus frequencies up to 50, 60, 70, 80, even over 100 MHz are reflected back to earth. In fact this last summer, a 220 MHz E-skip QSO was verified over a few hundred miles, but that is a rare exception.

The most common E-skip reception is on channel 2 (the lowest frequency) from about 1000 miles away. Here in Southern California, frequent "visitors" on channel 2 are from Midland, Texas and Denver, Colorado, for example. My personal reception records distance wise are Saskatchewan to the North and Mexico City to the South.

If the E-skip is really strong, it will be in effect up through channel 6 and even into the FM band. And some hams see E-skip on 2 meters on occasion.

We are at a sunspot peak, and the E-skip conditions are especially good right now. The peak months are June and July, and I'd expect to see something almost every day this Summer.

So what does it take? The primary asset is living somewhere that channels 2 thru 6 are essentially devoid of local signals. Well, that doesn't apply in many areas (California's San Joaquin Valley is Nirvana for TV DX). But here in San Diego, for example, channel 3 is vacant and I can steer a rotary TV antenna away from LA enough to pull E-skip signals out on channel 2, 4, and 5 if they're strong enough. No special equipment required--you can sometimes receive distant TV stations with rabbit ears! By extension, these comments apply to the FM band as well.

Someone asked about publications. Many moons ago (1960 plus/minus) I subscribed to a magazine called "TV DXing Horizons" which was published in Modesto, CA. I'm sure it's long gone, but there is a group called something like the TV-FM DXing Society, and I think several people on the net belong. I'm sure they publish a newsletter, station lists, etc.

A handy piece of reference material is a list of TV stations around the country. Until recently the best source was the "North American Radio and TV Station Guide," a Sams book authored by Vane Jones. But it hasn't been republished in several years and is terribly out of date. (Does anyone know why? Is Vane dead?) But at least the most recent edition will tell you what cities have channel 2s and that's a good place to start.

This might be a good forum to compare reception notes this Summer. Three of us did that informally last year with our own mini-Net, and on days when reception is good out here, it generally is good throughout the country. In fact, on days when TV E-skip is "in," check out 10 meters for some places you don't normally work on 10 (i.e. relatively close by), 6 meters for almost anything, and 2 meters for unusual repeaters.

TV stations are quite good about QSLing DX receptions, by the way. I have cards or letters from 20 states, 3 Canadian provinces, and Mexico that I've accumulated over the years.

So, good DXing to us all.

--Jim, K6ZH

P.S. Rarely does only one station come in at a time. The result is noisy, blurry, color fading in and out, sound from one station over a picture from another, etc. If there's someone in your household who isn't too fond of listening to radio interference, TV DX will drive 'em nutz!!

1660. FAIR INTERNATIONAL DX CONTEST

[NOTE: Message modified, 15 Mar 90 11:47:54]
I have had a number of replies and suggestion about how to create a fair DX contest. However most of these have been through private mail. Maybe if we could open up this discussion for all to see we might be able to generate enuff ideas to get the momentum to have one of the large ARS organizations pay attention and actually formally sponsor a "FAIR INTERNATIONAL DX CONTEST" which anyone in any location with any equipment would have a shot at winning. Let's not forget that there is no doubt that unless the

operator is competent and competitive no matter the location or equipment there will be no chance of winning. All suggestions and discussion welcome.

From personal experience with a CB and magnetic mount antenna, I would recommend getting a CB with microphone mounted channel controls. It is very convenient while driving. I would also get a CB with an analog noise limiter(ANL). Radio Shack carries such a CB, but it is around $100 regular price. I have a Midland CB(don't remember the model number) with the above specs. I would recommend a K40 antenna above any other. The fiberglass cover one is nice, since it won't rust.

Anyone have any idea how I might locate the following folks? I would
dearly love to get QSL's for these qso's that I made in the 60's

KZ5CU, Joe in Ft. Clayton, Canal Zone, worked Nov. 13, 1964 on 14.070 cw at 1703
CR6GS, Henry in Nova Lisboa, Angola, worked March 6, 1965 on 21.090 cw at 1327

Any help would be greatly appreciated.

73,
Mike

I'd recommend W4MPY out of Monetta, South Carolina. He advertises in QST every month so you can get the address there. I have done business with them, and they produce a very nice card for a VERY reasonable price. They can do customs or you can pick from a number of standard designs. They will also send you samples, pricing and an order form for the asking. Also, they rarely charge for extras such as logos or awards, which a lot of the others have a fee to include in your design. Give 'em a try- you won't be sorry, but if you are, they'll refund your money.

I have no affiliation with QSLs by W4MPY other than as a satisfied customer.

Check Gail's QSLs in Missouri. They're *vrey* inexpensive and do the job...
Don't be looking for exotic graphics or neat little pictures, though.
Their QSLs are simple and useful...

1667. two antennas - one feed line?

Newsgroup: rec.ham-radio
Date: 1990-03-15 23:09:59 UTC
From: jneher@tenorman.Sun.COM
Message-ID: <132992@sun.Eng.Sun.COM>
Source record: 12872

Hello,

I own two j-pole antennas, one for 2 meters and on for 440 Mhz.
Does anyone know if there is a simple way to hook them up
to one feed line (i.e. present the appearance of
a 50 ohm, dual-band antenna to my dual-band transiever)?

Thanks,

Jonathan Neher

+>I would key in 160.0 but ....it would change to 163.2768
+>
+Just that 2^15 = 32768.... Here's a wild guess but I'd say the 15th bit
+going between your keyboard and the PLL/Display circuitry was stuck as
+logic "1" causing you a bunch of grief.

I agree that it has something to do with 2^15, but it is not the PLL/Display. Data is sent via a serial to the display and to the PLL's. Keyboard inputs generate scan codes which are read by the u-proc and converted to serial words for the PLL and display, and are also converted to parallel 8 bit data and stored in memory as 4 bytes which hold the value of the 1st mixer freq and 2nd mixer freq.

I suspect a glitch in the u-proc programming. Pressing the reset button recessed on the back should re-initialize the unit. YOU WILL CLEAR ALL CHANNEL MEMORY WHEN YOU DO THIS.

If this doesn't fix the problem, you could e-mail me several examples of the freq you put in, and what it put out, and I could calculate the 1st and 2nd mixer divide values to see what is common.

good luck.

> The schematic seems to indicate that D6 is only there in the Italian version
> of the IC-2SAT. Does the Italian version offer the 108-136 band by default?

The Italian version of the IC-2GAT offers full band transmit out of the box,
so this is a fairly safe assumption. Got your passport?

I suspect either the regulations or the enforcement in Italy are very lenient
in this area.

> Where does one get this diode?

You don't have to use a chip diode, **IF** you can find a place to put an
ordinary "big" one in. You can get chip diodes from dealers like DIGIKEY
(call 1-800-DIGIKEY). Many chip diodes come in 3 or 4 terminal chips that
have many combinations of diodes in and out. Be sure you are getting the
correct one for what mod you are applying.

NO!! I agree with the Webster's definition.

What I am saying is that we are actually TREATING privileges as DIFFERENT
than the Webster's definition.

> of the word changes, I guess we'll all have to live with it, or quit calling
> our amateur activities privileges and call them something else.
> In my opinion, I think "privileges", as defined by the dictionary, fits the
> situation perfectly.

We agree on the definition, but we disagree on whether the current activity
meets this definition. You say it does and I say it does not.

I believe we should make it match the definition.

If your two antennas present an INFINITE impedence at the T point on
the opposite frequency, then you can directly connect them. However
this is very unlikely.

What you need is a duplexer at the antenna. This device splits the
RF based on freqeuncy. Larsen and Diamond make them and others probably
do as well. Any dealer worth their salt carries one of these.

If your dual-band radio has ONE RF connection, then it has an internal
duplexer. An example is the ICOM IC-3210. If not, then you will need
another duplexer at the radio end. Certainly you need this if you are
using a pair of single band radios.

Typical duplexer costs are in the $50 ballpark.

From: bobw@col.hp.com
Message-ID: <18230001@col.hp.com>
Source record: 12778

Excerpts from the ARRL handout on operating in Mexico
[dated June 1988, approx.]

The United Mexican States has not entered into a reciprocal
licensing/operating agreement with the United States (though the
two countries share a third-party traffic agreement).

Mexico, however, issues operating permits to U.S. amateurs
on a courtesy basis. Upon arrival in Mexico, visit the nearest
Delegacion Regional de Concesiones y Permisos de Telecomunicaciones.
There are many offices througout the country, and a list of them
is available from the ARRL Regulatory Information Branch for
a business-size SASE.

You should take the following:

- A written request for a temporary operating permit, which
contains information on your equipment, address in Mexico
(friend or hotel/motel) and automobile.

- A copy of your tourist card or visa (issued free of charge
by the Mexican consulate located in many U.S. cities or by
the immigration office in Mexico).

- An HD-1 tax receipt for a license fee (37,000 pesos, or $26,
as of September 1987) paid by you at the nearest Office of
Secretaria de Hacienda y Credito Publico.

- A copy of your FCC license

[stuff deleted]

Guest operation by foreign amateurs of XE stations is permitted.
[stuff deleted]

Phone patch operation is discouraged except in emergency communications.

The following are editorial comments by KB0CY (based on talking to
several US amateurs who hold XE licenses)

* The actual procedures seem to vary, depending on where you are
in Mexico.

* The license is good for the same length of time as your tourist
card which is usually 6 months. It is not easily renewed -- it
requires the same fee & hassle all over again.

* It takes about 1/2 day to obtain the license (if things go well).

* The latest info can be obtained from the ARRL for an SASE.

* Contacting a local amateur or someone who has obtained a license recently is very helpful.

*

Our club station (K2GXT RIT ARC) uses a very nice QSL. We can afford to do this because we use the same QSL as the local Rochester club. They can buy them in quantity, make a few plates to personlize them, and produce many cards in the same printing, saving time and money.

See if yuor local club offers such a service.

I would like to know if Spring and Summer has any effect on reception.
For the past few days, it has been very hot in NJ and the reception on
my Sony-2010 was poor and there was lot of disturbance especially tuning
to All India Radio. However, there was no effect on BBC and other major stations

Can some enlighten me in this regard.

From: genem@hpindda.HP.COM
Message-ID: <5120008@hpindda.HP.COM>
Source record: 12783

Hi,

Depending upon the amount of work you do on 440, the answer is you need to do nothing. Using a 2-meter J-pole on 440 only results in an SWR of 1.8:1 or so! I couldn't believe it either until I verified it. That is about the same as a rubber duck if you were anywhere near a wall or something.

If you operate a lot of 440, you may want to consider something else, but I thought you would be interested in that fact.

73,
Gene

>various reasons not tested to that standard. (Class A is, in general, a looser
>requirement than class B, but there are other considerations taken into
>account by manufacturers when they choose which class to certify to.)

Well.... I don't know where he tests computers, or what he buys, but FCC
level 'B' does not come for free in any +modern+ computer (aka over the
last 7 years). If a "CLASS A" computer is tested and acutally exceeds the
limits of a "CLASS B" device I do not know a single person in any company
that would not list it as a "CLASS B" device. I have tested computers
from many companies and getting to Class B is no small task. A class
"A" device will in almost all cases be much hotter than a Class "B"
device. When we do testing at my company it takes nearly 3 months to get
to the point where we can submit to the FCC on almost any product that is
class 'B'. Getting to Class 'A' takes one week and no submital is required.
That should say something about the work involved.

The person who originally asked for the help had a problem with a Class 'A'
device. I would bet that he also had problems with his FM Radio (some
freq) and his TV if it used an antenna and not cable.

A Class 'A' device has no place in the home and especially no place in the
ham shack where the ability to hear RF (that rare DX station) is critical.

>
>Even Class B devices may cause annoying interference, if they happen to
>generate RFI at a particular frequency of interest to you - as may be the case
>here. Also, not all interference comes over the power lines, so it's not
>too suprising that adding a line filter didn't help. (Actually, given that
>it's relatively simple to keep VHF frequencies off the power cord, I would've
>been surprised if conducted interference had been the culprit here.) You
>are more likely seeing interference radiated from the system.

All true and shows that even Class 'B' devices are not perfect from a
hams perspective. So why not get the best that you can and avoid most of
the problems.... As a side note, If you see a "VDE level 'B'" sticker
on the product that is better yet since it has been tested to an even
harder standard (this test is harder on conducted emissions and also

checks for Magnetic emissions).

I deleted all of the suggestions to conserve net bandwidth... All are valid...

2.4 kbits/second suffices for digitized voice, with appropriate digitizing
algorithms.

I have recently aquired a JIL Scanning Monitor, it is marked
HF/VHF/UHF and FCC ID BGL90MSX-400 but has no model number.
It also came with a UHF converter (800-1400 MHz) JIL model RF-8014.

It seems to work and be reasonably easy to operate, but came with
no info. I am looking for at least the operators manual, and
possibly a service manuel. I have had no luck locating the
manufacture are they still in around?

I am particullarly interested in the functions (interface to) of
the rear pannel connectors, the 34 pin remote control, 3 pin AUX
control and the 5 pin REC control.

Does anyone know anything about this beast? Is it worth investing
my time in it? Has anyone done a review?? About how old is it,
and what was it sold for new?

The poster of the basenote is trying to get from 5 to 13. I'm trying to break the 13wpm barrier and get to 20. I ran into a guy on the 80m novice CW band that suggested that I copy in my head by sound, without writing it down.

One of the problems with writing down characters while listening is just that - you can't do two dissimilar things at once. By getting the translation part down, you can buffer words in your head, then write down words link normal people do. The key is to compress the information in your mind as much as possible - concentrating on word sounds, rather than sounding out letters. For example, what sound is easier to remember - "example" or "e"-"x"-"a"-"m"-"p"-"l"-"e" ?

I've tried this approach, and find that I can understand most characters at 20 wpm, but I'm still having trouble buffering the words. The worst words are ones that are not spelled the way they sound.

>
>'73, Randy WK9M

Randy, Please be very carefull! Some stereo amps can not take the low
impedance that a capacitor across the output will present at ultrasonic
frequencies. Typically, wide-band response amps "see" a load that is
almost a short circuit at higher frequencies. Some amps will shut down
due to excessive current in the output. Other amps burn up the output
stages because the capacitive load changes the original design parameters
used for the amp's internal feedback...the amp go into high frequency
oscillations which may not even be heard in the speakers (BTW, this can
also burn out the voice coil of tweeters due to excessive high freq.
power levels that they were never designed for).

I learned about this little problem first hand when I was a stereo
service tech and had to rebuild an amp when the owner put >shielded<
wiring to the speakers in an effort to solve an RFI problem. There's
lots of capacitance added with this type of wire.

Before you charge ahead, contact the manufacturer of you stereo for
their exact recommendations on resolving the RFI problem. Perhaps
the signal is not entering through the speaker wiring at all...mayby
it's coming directly in through a non-shielding plastic case into the
low level circuitry or perhaps its coming in through the line cord.

I have the same problem with my stereo, a buzzing sound when transmitting,
which I found could be cured by moving the transmitting antenna further

away...a case of fundamental overload.

Good Luck with this problem...it can be very frustrating to resolve.

Theoretical Bandwidth is 22KHz; 19.2Kb (or 2x9.6Kb) are pretty close.

>b. Leased data lines

Depends on how much money you want to spend. ISDN over simple 4 wire pair goes about 144Kb. OC3 service will get you 155.52 Mb, but will cost a whole lot more.

>c. RF (mainly microwave)

Yo, Glen? What are you up to these days? ;-)

Seriously, using cheap stuff, some common data rates are 240.3Kb, 1.544Mb, 10Mb. Define cheap as being under $500 per end.

Don't put too big a cap across your speaker terminals to cure RFI.
It might cause instability in the amplifier.

In fact, 330 pF capacitors are series-resonant at about 146 MHz (assuming short leads), so would make an excellent bypass capacitor for the 2 meter band. This should be small enough not to mess up amplifier response.

Yes, buy a 2m 70cm duplexer and put it at the end of your feed line.
This will make your 2 antennas look like one dual bander. The cost for
a good outdoor duplexer from larson is about $60.00. Good luck.

This discussion seems to be drifting back to "code vs no-code" via "new" ideas for licensing exams

Most of the ideas presented so far approach a call for two classes of license: (1) Radio Operator (RO), and Technical Operator (TO).
The RO license would be issued to anyone who could demonstrate proficiency in 1. Coming up with enough money to buy a rig, computer, peripherals, antenna, software, and tuner.
2. being able to locate the on-off switch and knowing which position is the "on" position.
3. Knowing the diference between a D-type connector and a PL-239.
4. The appropriate terminology to use on 2-meter FM (voice) and packet routing.

The TO license would require substantially the same technical knowledge as is now required, with the addition of a few questions regarding FCC type-acceptance and what types of equipment may be used in which radio services.

A person could have either a RO, a TO, or a ROTO (combination) license.

In practice, a RO could not make any adjustments to equipment that would affect the frequency (other than the tuning knob(s)), the output power, or the modulation characteristics of the transmitter. But could use any FCC type-accepted equipment that they could find a way to chain together to effect communication with other stations. The TO would not be under these restrictions and could modify, build, or make any adjustments to equipment that would not result in emitting a signal outside the limits placed on the service. This would, of course, include modifications or adjustments to RO equipment.

For both the TO and RO classes (commutatively applicable to ROTO), a comprehensive operating rules exam would have to be passed. It would be an open-book exam to encourage reading and studying about the radio service they are (or hope to be) licensed for. Such an exam would be required at annual intervals to maintain this encouragement. It would cover such aspects as: (1) What the band limits are and why they are there. (2) What modes of operation are allowed on each band. (3) What to do when the frequency you want to use is occupied. (4) How to Call another station; and how to reply to a call. (5) when you need to ID your station and how it is to be done. (6) What is music and what is profanity (not a court definition, but a service definition). (7) How To Be Courteous and Considerate. (8) What the transmitter power limits are. Finally, an actual operator run, with two VE's unknown to the testee evaluating would be administered. The operator would be required to ACTUALLY operate his equipment, in the presence of the evaluators, in each of the modes he intends to run. Successful demonstration would

then be indicated by checking off the appropriate blocks on the license application.

This would do for a start. The Lawyers can add myriad details to each point as they see fit. Notice that the dreaded letters, CW, will only appear at the Operator Evaluation Annual Test (OEAT), and then will apply only to those expecting to actually operate this mode.

To make sure that operators adhere to their license conditions, any operator found to be operating in a mode or manner inconsistent with his license would have his equipment seized and his zicense revoked for six months, or until his next annual renewal date, whichever is later. Such an operator would be placed in "Status Operator License Activity Revoked" category (SOLAR).

> K1TWF

I can't help you specifically with THESE calls, however a little sleuthing may produce results. When I got back into DXing in '82, after being off the air for 6 years and not interested in DX for a few before that, I found I had QUITE a collection of QSO's with DX countries for which I needed a card (for DXCC credit). I got myself the latest copy of the DX Callbook and started looking up the countries (hopefully to get addresses of these old stations). More often than not, the guy you worked is still around. For example, even tho' CR6 is no longer the prefix for Angola, there aren't too many hams in that country and examining the list of (I think) D2 calls listed may reveal one such as "D2GS" with the same first name and in the same city. Bingo! Odds are you just found him! With KZ5 stations, you will have a problem, since those were military personnel stationed in the (then) U.S. Canal Zone. However, there are ways to track at least some of these folks down, assuming they're still alive and licensed. "QRZ DX" is a newsletter published exclusively for the DX community and if you write Bob W5KNE (the publisher) and tell him you'd like to find the whereabouts and QSL info for such and such (your KZ5 for example), he'll publish your request in the newsletter. Many people read it and the odds are pretty good that someone knows the guy (again- if still kicking and/or licensed) and will pass the info along. Another tip is the "GO List"- published by W6GO, this is a list of QSL managers/ QSL routes. Though most are for the more or less current crop of DX stations, there are many old stations still listed- I think he claims something like 6000 stations/ managers QSL routes.

Now- you've found him, how to get a card? I found that a letter to the guy, much more than a QSL card (or at least along with a card) is the key to success. Tell him how much you enjoyed the QSO "n" years ago, and how you really need the card (if you do) for an award, or

for the sentimental value. I've found that the vast majority of these guys still have cards around, even from calls they no longer hold, or from DX-peditions long past. If it's a DX station, help him out- he may have been using a manager years ago, to reduce his postage expenses. Now you're writing him direct, asking for a card- include some postage money (at least some IRC's) so he doesn't have a real good reason not to help you- oh yeah- also a self-addressed envelope (not SASE, but SAE). I did this with about 20 countries when I got back on, and I got cards FROM EVERY ONE- in fact, I got some of the nicest letters back, welcoming me back on the air. It was fun. One thing- make sure, to the best of your ability, that you have ALL the QSO info correct (dates, times, freqs, etc.)- if he has to go through a large number of logs to find the QSO, he'll be less likely to help you.

The only bad news is trying to find a U.S. station who has changed his callsign- I have not found a good way to do this- the FCC computer doesn't hold callsign change info for very long, I guess, and they're not very cooperative. Sigh.

Well, this has been long, but I hope somewhat helpful. Good luck in your detective work.

How about a phone call to Mosley? their number is (314)994-7872. I'm sure they will supply you with a set of assembly instructions for little or no money, especially since the antenna is still in current production.

This isn't a flame, but I think any info you might get regarding assembly over the net, without having a picture to look at, would probably be difficult to follow and could well result in the best looking dummy load in your neighborhood.

Hope this helps.

The following is forwarded on behalf of Michael Covington, whose system does not now permit him to do so himself.

Date: Thu, 15 Mar 90 00:41:14 EST
From: asuvax.eas.asu.edu!CORNELLC.cit.cornell.edu!MCOVINGT%UGA.UGA.EDU (Michael Covington)
Subject: Ham radio anthropology
To: Bryan Pfaffenberger <xb.p07@forsythe.stanford.edu>
Cc: Jim Grubs <jim.grubs@w8grt.fidonet.org>

I just saw your appeal for information about the social values of ham radio enthusiasts. I've been around ham radio, and reading about it, for perhaps 25 years though I've only been licensed for two years.

(1) Ham radio is definitely egalitarian. There are awards and other status symbols (especially the ascending classes of license), but most people take the attitude that anyone could attain these with suitable effort and inclination.

Hams generally _conceal_ their social status when on the air. Just today I was browsing through QST Magazine for 1949 and came across the following story, which is typical: An American sergeant who was a ham found himself in an isolated place in Europe without supplies. He called a ham in Germany and asked him to deliver a message to headquarters. The ham in Germany did better than that -- he turned out to be General LeMay and he sent out the shipment himself.

(Computer BBSes today have a similar ethic. I've several times found myself talking to 15-year-olds who blissfully assumed that everyone on the BBS was a 15-year-old. I only "pull rank" when necessary to end a long pointless dispute.)

The use of non-voice modes (Morse code and more recently RTTY and packet) enables hams to conceal their dialect, accent, etc. I've been told that through much of this century, black hams preferred Morse code because they could communicate with whites on equal terms.

(2) Sharing ethic: Yes, certainly. (In fact I have a hard time getting hams to realize that commercial computer software can't just be copied indiscriminately.) A typical ham would rather _give_ a piece of equipment to a young new licensee than _sell_ it for a good price. Sharing of information, sharing of equipment, and selling at low prices to other hams are standard practices.

(3) Social service ethic: Definitely! To get a ham license, we have to study Part 97 of the FCC Regulations, which define the purpose of ham radio -- it includes enhancing international goodwill, serving the public, and developing or disseminating technology. Ham radio is _not_ just a hobby.

Many hams enjoy doing many hours of public service work every year. We _all_ are available to be called on in emergencies. There's a general feeling that any ham who is not willing to do public service is not worthy of a license.

For example, the National Traffic System is a volunteer network that relays messages ("radiograms") for free. Right now it's just a hobby, but if there were ever a major telephone outage, it would swing into action as a valuable communication service. (Some of this happened when Hurricane Hugo disrupted communication in the Southeast.)

What's the main DIFFERENCE between ham radio and computing? I think there are two:

(a) Ham radio is ipso facto a community. You have to have people to talk to. Computing _can_ be pursued alone.

(b) Most computer hobbyists are trying, on some level, to make money with their computers. Lots of times, they do good, useful work. Sometimes, they write programs and give them away free with notices that "if you use this for more than a brief trial period, you must pay me $100" and then grumble that nobody pays the $100.

Among computerists I've sometimes found a money-grubbing attitude that is, by regulation, absent from ham radio. You _can't_ make money with ham radio (at least, not directly). It's forbidden by FCC regulations.

1697. Six-meter beacon list (comment)

Newsgroup: rec.ham-radio
Date: 1990-03-17 15:00:34 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9003171500.AA22797@cmr.ncsl.nist.gov>
Source record: 12814

Thanks to KA1GD for posting the beacon list. I have a couple of comments.

J52US and 9L1US are the same fellow and rig. He is a 9L1US now-a-days.
Thus J52US should be deleted.

I think the Netherlands Antilles beacon,
PJ9B, is the one run by Chet, PJ9EE. Chet moved to Bonaire a couple of years ago and the beacon quit and was sent to him. Right now it is in my radio room in the process of being rebuilt (%$^*%**&^# Hamtronics). I'll get it back to him sooner or later. Its power is about 10 W, and will be on from Bonaire when reactivated.

It would be useful to note which beacons are A1 and which are F1. Most are A1, but FY7THF and '4OOJ are F1. 'THF sends SSSsssssooooooo slowly it is hard to copy.

73, Bob W3OTC

>I disagree with the concept of making privileges a reward. This makes it
>something like a prize.

I have to agree there. Dolphins get rewarded for jumping through hoops.
Children get rewarded for behaving in the restaurant...Don't you think
WE could make the whole process more logical (and Dignified)?

>The exams SHOULD measure how capable we are of NOT abusing the privileges
>that we want to have.

The present system is a lot like taking a Physics class and being tested
on Music Theory. Knowing Physics may help you understand why note
combinations sound dissonent or consonent, but should you have to know
one, that you will probably never use, in order to do the other?

>Prizes are offered for doing things that may in fact NOT be related to the
>nature of the prize. We should not be doing this in ham radio. VHF/UHF
>privileges are unrelated to Morse Code for most people.

Thanks Phil. How many of you have ever run VHF or UHF CW? Not a heck
of a lot of fun compared to using the low bands, is it? Why require
code testing if nobody (or practically nobody) uses that mode in that
bandspace. Stop hideing behind the defense that "If we don't test code,
Ham Radio is going down the toilet like CB". If we keep insisting on
code testing, ham radio will go down the toilet. Let's concentrate on
training our hams on emergency procedures, operational courtesy, and the
like. Let's stop allowing hams to go years without learning how to
PROPERLY participate in a traffic net. Right now, it's pretty sad.

>--Phil Howard, KA9WGN--
><phil@ux1.cso.uiuc.edu>

Thanks Phil, I think we better set some real goals for Ham radio and
work toward achieving them. If CW is legitimately part of the plan,
fine. If it has truly become a relic, let's treat it as such.

1705. Ham Publicity on TV (VK-style)

Newsgroup: rec.ham-radio
Date: 1990-03-17 21:24:16 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9003172124.AA23073@cmr.ncsl.nist.gov>
Source record: 12815

I just returned from a 10-day business trip to Texas and California
(I'll bet you noticed the reduced net traffic). On the "middle" weekend
I stopped by W3XO/5 (& XYL), who had returned the day before from three weeks
in VK and ZL. Among the several hours of 8mm video was a visit to VK2TVG.

Just by chance one of the Sydney hams suggested a visit to VK2TVG. Bill
had never heard of it, but was "game". It turns out that 'TVG is a ham-
operated TV station, "channel 35 plus", that is in the regular UHF TV region
and can be viewed by the general public on regular, unmodified TV sets.
The VKs had a 576-585 MHz ham band, and the ham TV repeaters and 'TVG have
been grandfathered, even though the band has been given to regular TV.

VK2TVG operates Wednesday, Friday, Saturday and Sunday evenings,
with programs (oops,"tests") about ham radio. There was a "test" about working
DX during Bill's visit. Wednesday carries new programs, the rest of the days
are repeats. It is in commercial-quality color, and originates from a ham's
KITCHEN!!!!! That end of the house overflows with switchers, VCRs, etc., etc.
While the power is only 100 W (they plan more), it is relayed by other hams.
It's an entirely volunteer operation that takes a crew of about 6-8 on duty
during "live" periods. The hams at the station asked Bill ('XO) if we
had operations like theirs here in the states.

When XO was later in ZL, he asked one of the leading ZL hams if he had heard
of VK2TVG. He had; in fact they had flown him over to VK to record an 8-hour
series of programs (oops, sorry) "tests".

'TVG is operated by the Gladeville (NSW) Amateur Radio Club.

An amazing operation.....

>73,
>Dube Todd N5PDK :)

I know this posting was intended as a joke, but I like it. I especially like the annual OEAT as this could be a good way to get an honest count of licensees who are still alive and active. I expect the number to be much smaller than reported in the flawed QST reports. I also like the idea that you be tested only on the operating modes YOU consider relevant to your needs while retaining comprehensive regulatory and technical exams as appropriate depending on whether you are a RO or TO.

Annual retesting of simulated on the air behavior might even reduce the liddism on HF a little bit. I doubt it tho -(. Lids are a social phenomina that testing will be unlikely to uncover or discourage. By and large these people are not stupid. They will be model operators DURING the test. Lids are a reflection of society's failure to integrate these people into the socially accepted norms of behavior.

> 4. The appropriate terminology to use on 2-meter FM (voice) and packet
> routing.

You leave out some important things:

People should have some understanding about radio interference, how to do
what they will do CORRECTLY (e.g. hook up coax and power), FCC regulations,
and safety.

Why should they need to know about connector types appropriate for HF when
we are planning to give them essentiallu UHF privileges?

> The TO license would require substantially the same technical knowledge as
> is now required, with the addition of a few questions regarding FCC type-
> acceptance and what types of equipment may be used in which radio services.

What the current requirements are, in terms of technically level, are the
MINIMUM that should be required for the least privilege. Anything less is
just CB (IMHO).

> In practice, a RO could not make any adjustments to equipment that would
> affect the frequency (other than the tuning knob(s)), the output power,
> or the modulation characteristics of the transmitter. But could use any

Sure SOUNDS like CB now!

> FCC type-accepted equipment that they could find a way to chain together

> these restrictions and could modify, build, or make any adjustments to
> equipment that would not result in emitting a signal outside the limits
> placed on the service. This would, of course, include modifications or
> adjustments to RO equipment.

NO NO NO NO NO NO !!
NEVER NEVER NEVER !!

I do not want to start having the FCC type-accepting ham gear, even though
some hams can be using the non-type-accepted gear. It will just end up
raising the prices for everyone.

>in an isolated place in Europe without supplies. He called a ham in Germany
>and asked him to deliver a message to headquarters. The ham in Germany did
>better than that -- he turned out to be General LeMay and he sent out the
>shipment himself.

I had forgotten that LeMay was/is a ham. From my online callbook:

Call: W6EZV
Class: General
Name: Curtis E Le May
Mail addr: 1046 Pescador Dr
Newport Beach CA 92660
Born: November 15, 1906 (age 83)

The name and year of birth matches the info about him in "The Making of the Atomic Bomb", so this is probably him. Does anybody know if he's still alive?

An interesting, if spooky character. The more I read about him, the more I'm convinced he was the inspiration for General Buck Turgidson (George C. Scott's character) in "Dr. Strangelove". On the other hand, from an incident documented in the PBS series "War and Peace in the Nuclear Age" in which he declared his intention to strike the USSR first if he saw the Russkies massing their planes (despite this not being US policy) perhaps he was the model for General Jack D. Ripper.

Barry Goldwater, Curtis LeMay... how come the hams who rise to prominent national positions always seem to be right wing extremists? :-) :-)

Phil

I vote for TORO. [:-)

Seriously, your ideas are very good - especially the on-the-air test on operating practices and CW proficiency. My only problem is, how do we certify VE qualifications? As we all know, those who already have licenses can't be presumed to know the gentlemanly rules of the road. Perhaps VEC's should be required to examine their VE's.

Hi everybody,

I am a beginner to HAM and don't know where to start.
Are there books that would help me start?
Is there an exam that HAM users take (for acquiring license maybe)?
I am in Wichita KAnsas, Is here a group that I can get in touch with?
Please suggest a low cost equipment that would weather the trials of
a beginner!
Please e-mail me at

pxgovind@twsuvax (on the BITNET).

Thanks in advance g.prakash

perry@hpfcdc.HP.COM (Perry Scott) writes:

>One of the problems with writing down characters while listening is just
>that - you can't do two dissimilar things at once.

Hmmm, I had that problem too when I was improving my code speed. I even went to trying to write with my left hand (I am usually right-handed) to decouple my ear-brain from my hand-brain (hoping that there was a left-lobe/right-lobe distinction). Nope, didn't work :-) :-).

What I did find to work (for me) was to, every now and then, when I reach a plateau, go to hardcopying with a keyboard - i.e., type rather than write. Now, I can't type 20 wpm either (I hunt-and-peck :-), so I couldn't completely keep up with a long string of message. But, a dozen minutes of this was enough to get the silly grey cells decoupled. And I find myself being able to hand-copy to the next plateau, where I go back to a keyboard for a few more minutes. Even so, it was not painless. It took me 5 months to go from about 2 wpm (I have been SWL'ing for 25 years and could recognize Morse characters) to 25 wpm.

And, of course, Farnsworth the thing. It helped me even when I was in the 15 wpm range (Farnsworthed to 20-25 wpm).

By the way, for those of you trying to find interesting source of messages, and live on the US coastal areas, the Coast Guard transmit weather messages in the LF/VLF region at about 18 wpm. Less boring than test tapes. Me? I wrote a program on an AT that keyed a pin on the printer port. I then used that to key an oscillator which fed the antenna spigot of a receiver. The source text that I fed the program were messages from rec.ham-radio (no kidding!), quite often the long ARRL bulletins.

NOW - here is an interesting one - I have been discussing this over lunch with an old friend who I am trying to prod to getting a Tech license. He is probably close to tone deaf, and his XYL and epsilon could copy better than him by just listening to him practice. It is like half a year now and he still cannot make 5 wpm. This OM needs help! :-) :-)

So, I suggested that he copies the dots and dashes down *verbatim* (hey, I think it *is* possible at 5 wpm) on the piece of paper they give you. Then, in the time they give you to answer the 10 questions, you translate the dots and dashes into Roman alphabets. I doubt they will ever give you credit for the "1-minute solid copy," but surely they have to pass you if you get 7 questions answered correctly, don't they? (My copy sheet for 20 wpm was pretty illegible, too, afterall :-)

OK, this is not in the spirit of the thing, but there simply are people out there who just *cannot* make 5 wpm. Any VE's out there want to

comment? Would you pass a guy who does this?

73,
Kok Chen, AA6TY kchen@apple.com

1715. G7 antenna note (for older models)

Newsgroup: rec.ham-radio
Date: 1990-03-18 19:54:53 UTC
From: rfc@briar.philips.com
Message-ID: <87406@philabs.Philips.Com>
Source record: 12821

Those of you in cold areas probably found out about this the hard way.
But if you live in warm areas, you may want to take a look at your antenna to
see if you are getting trapped water. Before corrosion gets you.

copied from packet (source unknown):
SUBJECT: - files\G7-ANT.MOD

IMPORTANT! YOUR G-7 WILL HAVE A PROBLEM IF IT WAS MFG. BEFORE 23 MAR
88. YOU MUST DRILL A DRAIN HOLE AT THE BOTTOM OF SECTION #5892 THAT IS
THE ALUMINIUM TUBING JUST ABOVE THE LOWER PHASING COIL. SPACE THE HOLE
AS THE ONE AT THE BOTTOM, JUST BELOW THE FIRST CLAMP. MY G-7 LASTED
ABOUT TWO MONTHS AS A REPEATER ANTENNA ON A MOUNTIAN TOP BEFORE THE
#5892 SECTION FILLED WITH WATER, FROZE, AND PUSHED THE PRESS FIT PIECE
AT THE BOTTOM OUT ABOUT A 1/2 IN. AND PUSHED THE #5891 SECTION WITH THE
REST OF THE ANT RIGHT OUT AND SOMEWHERE INTO THE WOODS. ...

1716. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-03-18 19:59:26 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9003190802.AA01952@ucbvax.Berkeley.EDU>
Source record: 12825

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

UOSAT-OSCAR-14 and UOSAT-OSCAR-15 REPORT #007 15-Mar-90

** UoSAT-OSCAR-14 **

Attitude Control and Stabilization

Manueuvers prior to gravity gradient stabilization have taken somewhat longer than expected. The most recent delays were caused by the need to add digital filters to the attitude determination software to remove unwanted noise from the magnetometer readings. The filters have been installed, and a new version of the FORTH diary will be uploaded soon.

High Speed Downlink Tests

The UoSAT Command Station has been conducting limited experiments with the 9600 bits/second Frequency Shift Keyed (FSK) downlink on UO-14. These tests have been quite successful, doubling the highest digital link speed previously used on any OSCAR satellite (4800 bps is routinely used on UO-11).

Data transmitted during these tests has been either asynchronous telemetry from the Very Large Scale Integrated telemetry system or continuous streams of 1 bits (no data at all). The "stuck ones" tests are very useful because of the scramblers in the modulator and demodulator. The 1's are scrambled and transmitted as pseudorandom data over the RF link. The groundstation demodulators then lock onto this data, descramble it, and reproduce the continuous 1's. Any 0's in the demodulated output data stream are caused by bit errors on the communication link, and the link bit error rate (BER) can be calculated from the frequency of such transitions.

BER tests are to be scheduled into the DIARY in aid of those trying to test their FSK receive system. The first scheduled tests were scheduled for the morning passes over the East Coast of the US on 15 March.

- de G0/K8KA.

** UoSAT-OSCAR-15 **

The team at Stanford has succeeded in detecting local oscillator (LO) leakage from the UO-15 command receiver. The weak signals were first detected on March 10 and then again on March 11. Roy Long, leading the Stanford Research Institute team on the recovery attempt, said that there is no dbt that the signal comes from UoSAT-15. It is weaker than the corresponding signal on UoSAT-14, as expected from prelaunch measurements.

Each UoSAT carries three receivers: a fixed-frequency command receiver and two communications receivers with switchable frequency. Efforts will now concen-
trate on monitoring one of the switchable frequency receivers. If one of

these receivers is heard, commands will then be sent to change the receiver frequency, which should cause a corresponding change in the LO frequency. Observation of changed LO frequency will confirm that the satellite's command system is basically healthy.

The work at Stanford is very time consuming, requiring azimuth and elevation control of the huge Stanford 150 diameter dish to within tight limits. Data are collected for only a few seconds, followed by hours of post-processing.

Don't give up the ship quite so quickly on these. With the excellent
new search capabilities that Devon has built into the marvin callsign
server, you can look up someone by last *and* first name. If he or she
is still licensed, that ought to do the trick.

ARRL Letter - Volume 9, Number 4 - February 27, 1990 - Part 1 of 3

FCC RELEASES TEXT OF NPRM FOR CODELESS LICENSE

In its release dated February 16, the FCC detailed its rationale behind several issues regarding its newly proposed Communicator Class of amateur license. The FCC sees Communicator as the class of license which most newcomers into the hobby would elect to qualify for. This premise was used as the basis for its proposed elimination of the Novice Class license. Since FCC also proposes a comprehensive 60 question written test for the Communicator, they contend that the Communicator Class will also take the place of the Technician Class for future licensees.

Under the FCC proposal, "a Communicator Class licensee who passes, or otherwise receives credit for a telegraphy examination, would be authorized the additional privileges of the Technician Class." FCC intends to further simplify its documentation process by permitting Volunteer Examiners to issue a Certificate of Successful Completion of Examination (CSCE) as proof of a Communicator's code proficiency instead of formally upgrading them to Technician. The upgraded Communicator would sign their call followed by the identifier "/AC" and it appears that they would do so indefinitely or at least until they upgraded to General Class or higher. Volunteer Examiners would be permitted to issue a CSCE to Novices successfully passing the Communicator written exam. Under the proposal, VECs would provide listings to the FCC of the Communicators with the Morse code endorsement. Finally, the FCC proposes that all examinations be administered by Volunteer Examiners saying that the VECs provide more credible results than does the two examiner system now in use for Novice examinations.

The deadline for filing comments with FCC is August 6, 1990. Between now and the July 20-21 meeting of the ARRL Board, the Directors are looking forward to hearing from as many members as possible to assist them in determining the League's response. The full text of FCC's codeless proposal will appear in the April 1990 issue of QST.

FCC ISSUED CALL SIGN UPDATE

The following is a list of most recently issued FCC call signs (February 1).

NEWS FROM THE ARRL DXCC DESK

Walvis Bay (ZS9) was added to the ARRL DXCC Countries List by unanimous vote of the ARRL Awards Committee on February 22. Walvis Bay is an enclave of the Republic of South Africa, surrounded by territory of Namibia. DXCC credit will be given for contacts on or after September 1, 1977. QSL cards may be submitted for DXCC credit on or after June 1, 1990.

The 5 Band DXCC Award is now endorsable for 17 and 12 meters, in addition to 160, 6 and 2 meters. These endorsements are available only for those who have already qualified for 5BDXCC on the basic 80, 40, 20, 15 and 10 meter bands. Send an SASE to ARRL Hq for the endorsement application form.

FCC SHUTS DOWN UNLICENSED BROADCASTER

Working together, the FCC Baltimore and Detroit Field Offices located and shut down an unlicensed West Virginia pirate broadcast station on January 30. Mark R. Leavitt was fined $1000 for illegally operating on 3.820 MHz in the 75 meter amateur band.

Unauthorized operation of a radio transmitter is a violation of Section 301 of the Communications Act. Sanctions may include fines from $10,000 to $100,000 and/or imprisonment for up to one year.
ARRL Letter - Volume 9, Number 4 - February 27, 1990 - Part 2 of 3

ARRL COMMENTS IN FCC WARC-92 INQUIRY

The ARRL has filed its comments in response to an FCC inquiry in general docket 89-554. FCC sought information to assist in addressing the allocation issues likely to be raised at the 1992 ITU World Administrative Radio Conference. In its introduction, ARRL said that it recognizes the

significance of the Inquiry and... "stands ready to participate fully in the process leading to the US position at WARC-92."

A primary concern for amateurs at the upcoming WARC is the issues that deal with spectrum allocations for HF Broadcasting. FCC asked for comments on the projected needs of the HF broadcasting service. The League responded saying, "There have been dramatic changes in the world since HFBC-87 [WARC for the Planning of the HF Bands Allocated to the Broadcasting Service. Second Session. 1987].. These changes are relevant to the projected needs for additional HF broadcasting service allocations." Some of these "dramatic" changes include: a significant reduction in jamming; easing of restrictions in certain countries which formerly discouraged pluralistic views in their countries; and increasing delivery of information and other material to target audiences by new communications technologies. The FCC also asked whether HF Broadcasting allocations have to be exclusive and, if so, should these allocations be regional or worldwide. To this the ARRL responded, "The HF broadcasting service uses high power transmitters and directional antenna arrays to deliver high field intensities capable of overcoming the insensitivity of inexpensive receivers with built in antennas. In contrast, the amateur... service uses lower transmitter power and more sensitive receiving systems. As a result of these disparate power levels, it is difficult for any other service to share allocations with the broadcasting service.

"... The amateur service in Region 2... has a requirement for access to 500 kHz of spectrum in the vicinity of 3500-4000 kHz because of the great reliance that is placed on use of this band for emergency communications networks. The requirement for access to 300 kHz of spectrum in the vicinity of 7 MHz is equally great, and is growing because of the diversity of modes of emission now being employed by amateurs. Interference from broadcasters is a limiting factor at 3900-4000 kHz and 7100-7300 kHz. As severe as this interference can be, amateurs do make effective use of these allocations... and often can find narrow frequency gaps between broadcasting stations where communications can be conducted even in the presence of interference. Loss of access to any part of these allocations would deal a severe blow to amateur disaster communications capabilities in Region 2. Those capabilities are now substantially lacking in Regions 1 and 3 in the absence of an adequate 7 MHz amateur allocation."

Commenting on other questions regarding frequency allocations affecting amateur bands in the UHF and SHF regions, ARRL noted "There are three amateur service bands within the 0.5-3 GHz range of interest for expansion of mobile-satellite and [other services], namely 902-928, 1240-1300 and 2300-2310/2390-2450 MHz." The League commented that the none of these bands are suitable for additional sharing as they are already being shared by Industrial, Scientific, Medical (ISM) and government radiolocation services, and at intervals throughout the remaining spectrum to 300 GHz.

With regards to proposed new space services above 20 GHz, the League commented that the needs of the amateur and amateur satellite services should not be overlooked when allocations are make for new services.

Currently, there are amateur allocations at 24-24.05 GHz on a primary basis and at 24.05-24.25 GHz on a secondary basis with radiolocation services.

The ARRL also commented.."Should the agenda for the conference permit, the US should as a matter of policy pursue the opportunity to effect increased allocations to the amateur services..." including: a new shared allocation with a bandwidth of 50-100 kHz in the vicinity of 5 MHz; an expansion of the amateur allocations at 10, 18 and 24 MHz; and a 50 kHz expansion of the allocation near 14.350 MHz. In addition the League requested that the amateur service allocation in Region 2 at 7.1- 7.3 MHz now subject to harmful interference from high power broadcast stations, be to the amateur service worldwide. ARRL said that it would be ready to provide further justification at an appropriate time.

In its concluding comments, the ARRL said "In 1988, the United States Congress adopted... the Federal Communications Authorization Act of 1988. Among other things, this law stated the sense of Congress that... Government agencies shall take into account the valuable contributions made by amateur radio operators when considering actions affecting the Amateur Radio Service... this legislation made it clear that the intention of Congress... was to urge government agencies that have such jurisdiction to avoid actions which would reduce amateur service frequency allocations. The League urges that this same goal should be adopted by the Commission in its preparatory efforts for WARC-92."

ARRL Letter - Volume 9, Number 4 - February 27, 1990 - Part 3 of 3

FCC STARTS WHEELS TURNING ON ARRL "PART 97 CLEANUP PETITION"

The FCC has assigned file number RM-7243 to the League's petition of November 14, 1989, to revise certain sections of Part 97 of the rules governing the Amateur Radio Service, better known as the "Part 97 cleanup petition." The purpose of this petition is to request the FCC to consider certain changes that they did not deal with in PR Docket No. 88-139, the major Part 97 rewrite which became effective on September 1, 1989.

The FCC's stated purpose of the 88-138 proceeding was "reorganization and deregulation of Part 97." Reorganization amounted to changing the order of the subparts and sections, which had become patchwork. The deregulation goal could be measured by the number of pages eliminated from the rules; of course, there was hope for some simplification as well. In its comments to the FCC concerning their proposed rewrite, the League made numerous recommendations, which took the form of a complete new draft. The FCC's Report and Order contained many of the League's recommendations, decided that others were substantive changes and beyond the scope of Docket 88-139, but left the door open for changes under a new proceeding. That's when the ARRL Ad Hoc Part 97 Rewrite Committee was called back into service to draft a cleanup petition.

In its petition, the League asked the Commission for a number of substantive changes. One was to ease restrictions on transmission of third-party traffic when operating under automatic control on frequencies

above 50 MHz, which presently allows such operation only when using AX.25; this would eliminate the nee for a control operator to be on duty whenever a voice repeater is used for a traffic net. The petition made a strong appeal to the FCC to amend section 97.121, which presently permits the Field Operations Bureau to restrict an amateur station operation, and entitle the amateur to a hearing in accordance with the section 316 of the Communications Act. The League again asked for relief from "the amplifier ban," which posed frequency and minimum drive power restrictions on commercial ampliiers because of illegal CB use. The present restrictions deprive amateurs from the opportunity to purchase amplifiers for the 24- and 28-MHz bands. The League feels that the restriction in section 97.515(c) that "no person may be a VE if that person's amateur station license or amateur operator license has ever been revoked or suspended" is overly harsh and that a person should be considered eligible to service as a VE ten years after such termination. The ARRL reiterated its request to permit amateurs to retransmit Department of Commerce time signals, weather and propagation forecasts.

As for cleanup, the League asked for definitions to be added for ASCII, AMTOR and Baudot codes, digipeater (to distinguish it from a voice repeater), emergency communications and tactical call signs. Technical improvements in the definitions of bandwidth and spurious emissions were also sought. The League also asked the Commission to add space telecommand, space telemetry, telecomand and telemetry, and to bring them into agreement with Part 2 of the rules. Additional amendments in some sections were recommended to reflect the definitional changes. The League recommended that the rules be amended to require at least four persons to constitute a club, as opposed to the present two persons. The cleanup petition requested flexibility in use of radio apparatus aboard a ship or aircraft; current rules require separate radio equipment for amateur operation, except that a common antenna may be used. The petition asked that the requiremnt that bulletin or code practice stations, for which material compensation is not prohibited (example: W1AW), transmit on all MF/HF bands be reduced to six MF/HF bands.

RTTY DX Notes, 1of3, 3/16/90

RTTY DX Notes for Weekending 16th March 1990.
Part 1 of 3.
BID: $RTDX1603

One wonders at times about some of the DXpeditions that explode on the
DX world, and promise QSL cards immediately on receipt of green stamps.
And there the matter seems to come to a halt. Take for instance JT0DX
and the operation of September last year. When, if ever, are the cards
to appear? Maybe they are still stuck in a printing press somewhere.

Our thanks this week go to I5FLN, JA1BLV, OD5NG, TG9VT, VE3JPC, VK2EG,
W1DA, W1UU, W0LHS and others. Thank you all for your help with these
notes.

RTTY DX Notes for Weekending 16th March 1990.
Part 3 of 3.
BID: $RTDX1803

ZS8MI will QSL via ZS6PT.

UB4HQ will collect his cards from Box 701, Poltava, 314011. USSR.

BY9GA will QSL via Box 12, Lanzhow, China.

UA2WJ will QSL via Box 535, Kalingrad 326061. USSR.

Notes Of Interest.

J28TY has been reported on 3584 and 7035 KHz around 2000Z.

LY2WW has also been reported on 3583 KHz around 2200Z.

RL8PYL, Alex, will fly to Vietmam on 18th March on his way to Spratley. He will operate in Vietnam before and after the Spratley trip, which means that the Spratley deal may be delayed for a few days. Also check the available information regarding donations to Vietnam. There is still some doubt.

EA9JV reports that he cannot get any vacation in time for the SO1 and 7X trip, so his part of the operation will be delayed. More later.

The Sahara part of the trip by the Lynx group is still going to happen.

Lord Howe Island. Well, you can forget it for this trip. There will be no RTTY, oh shucks.

Aves Island. The Venezuelan Radio Club will operate from Aves Island on 11th to 15th April as YV0AA. They will use RTTY, AMTOR and packet. QSL to Venezuelian Radio Club, Box 2285, Caracas 1010-a Venezuela. Put the expedition call on the envelope.

Jarvis Island. A group will go to Jarvis Island April 13th to 23rd and operate under rule 3b of the DXCC criteria. QSL to Box 2368, Stanford, CA 94309-2368.

JA3PFZ reports that there is a plan to operate from XU and XZ in the near future. More later.

>newsgroup is to discuss, the name should be rec.arts.tv.community or
>something specific like that. (I thought of suggesting "rec.arts.tv.commun"
>but figured that would be interpreted as "communist tv"... :-)
>

Well I suggested a while ago the idead of 'rec.tv.cable' and it seems that there is a great deal of ambiguity as to what would be infered from the various group names. Instead of arguing about the name being used for cable TV or communinty access TV, why not have the following:

1) 'rec.tv.cable' : a discussion group for cable tv
2) 'rec.tv.community-access' : a discussion group for community access tv

This seems a pretty common sense solution to both parties - those that think the original group name should be for cable tv, and those that thought it should be for community access tv. Two groups for two different interests.

What does everybody else think?!

Just thought I should mention that Ham Radio is again getting some free advertising. Worcester Telegram published a large article in the Sunday, March 18, 1990 paper about a local radio club. Mostly, it discussed the Emergency Preparedness aspect of ham radio, but also discussed some of the more fun things, like DXing, etc. It was a pretty good article and even had a picture of a local ham at his shack.....only one bad comment..... they spelled one of the names wrong....it's Cayen, not Caen. Ah, well...

(PS, for those who don't know, Worcester is in Massachusetts)

A good place to start is the ARRL (American Radio Relay League). I don't have the address handy but their phone # in Connecticut is (203) 666-1541. Tell them that you're interested in Ham radio and where you're located and they should be able to help you from there. Another place for books, etc. is the local Radio Shack. They don't always have info but they may be able to point you to some local hams. Good Luck

He was/is a real character, sure enough. The late Arthur Godfrey, K4LIB, who was a general in the USAF Reserve, was a friend of his. He told of a hunting trip he, LeMay, and others went on out west. They split up to cover more territory. Godfrey spotted a deer and fired. He missed. He fired again. He missed again. By this time the buck realized he was in no immediate danger from Godfrey and proceeded to calmly walk across the clearing, grazing as he went. Godfrey kept firing and missing, 6 or 8 shots all told. In disgust, Godfrey

gave up and went back to the place they had parked the Jeep. LeMay was there chewing on his cigar and breaking down his rifle. Without looking up he calmly asked "Well, Gen. Godfrey, did our boys take that hill?"

Art Collins had given LeMay a complete Collins SSB station for his home use and LeMay was so impressed by the effectiveness of SSB that he became instrumental in getting the Air Force to switch to SSB. Needless to say, this led to Collins selling the government million$ in KWM-2's and 30L's.

> some of these folks down, assuming they're still alive and licensed.

Exactly. A friend of mine tracked down a KZ5 card by looking him up in an old KZ5-era callbook. Once you have the guy's name, you can look him up in a sorted-by-lastname-callbook or use one of these callsign-servers on the internet. If he has a current USA ticket, you've got him! These listings also include birth date. So if your KZ5-blah-blah is named Robert Smith, you can probably eliminate any Robert Smiths who were born after 1960, unless your Robert Smith was a military dependent kid ham.

This method is good for tracking down any US amateur who was hamming overseas at one time, but it is particularly good for KZ5's who were mostly US people.

Oh. And one last comment. This method is not limited to US hams -- it's just easier with US hams. For instance, if you are tracking down a card from Angola, go look in an old callbook and find the guy's name. Then go look at the Portugal listings (exhaustive search, yuck) in a current callbook. Then send the guy a letter and a QSL. Get the picture?

1728. Italy gets permission to operate on 50 MHz

Newsgroup: rec.ham-radio
Date: 1990-03-19 18:09:57 UTC
From: reisert@victim.enet.dec.com
Message-ID: <9003191809.AA23802@decwrl.dec.com>
Source record: 12680

From Gian Moda, I7SWX 19-MAR-1990 03:18

**** ITALY ON 50 MHz ****

The Italian PTT has released to italian hams the 50MHz band, after long work of A.R.I. and a positive ok by the Italian Ministry of Defence, with a doc.n. 11422 dated 6 march 1990, but with the following conditions :

- Frequency : 50,157.5 MHz +/- 6,250 Hz with a total band of 12,5 KHz
- Maximum RF Output Power : 10 W
- Service : Secondary (this band is used by Army services)
- Authorization : Following a request to the PTT Authority by single operator or group of operators (only full privilage licencees)
- Time-period : 1 year with possible renewal.
- Modes : A1A (CW but no modulated telegraphy) and J3E (Single Side Band but only upper band : USB)
- Absolute frequency limits : 50,151.250 MHz and 50,163.750 MHz
- It is forbidden the activity of beacons, FM emission or other modes (Packet and others).

It is the beginning for italian hams but we must be very careful not to go "outside" of the PTT guidelines to avoid any possible negative reaction for the renewal and possible extension of band.

Soon (time to get the authorization) several italian call-sign will be heard on 50 MHz. Please spread the NEWS.

73 de I7SWX - Gian MODA (one of those that requested the special permit).

1729. New British Callsign Scheme

Newsgroup: rec.ham-radio
Date: 1990-03-19 18:28:51 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9003191828.AA26436@cmr.ncsl.nist.gov>
Source record: 12695

NEW CALLSIGN SERIES FOR BRITISH HAMS
(Extracted from March 1990 Radio Communications)

....
At present all UK callsigns begin with the letter G. However, both the present Class A (with code) series, G+0+3 letters, and the Class B (no code) series, G+7+3 letters, are rapidly running out. ("5" will be issued for Class B when the "7"s have run out.)
The Dept of Trade and Industry (DTI) plan to go to callsigns beginning with the letter "M" for ALL new licences of both classes when EITHER the present Class A or Class B series runs out.
In the M series, the number will indicate the UK country, and a letter will indicate the licence class, ie: 2=England, 3=Scotland,4=Wales,5=GI,6=GD, 7=GJ, 8=Guernsey, 1,9,10=spare.
Calls will be like MA2AAA, which would be MA3AAA if the station moved to Scotland. The MB prefix will be used for special events, and MC for clubs.
MA and MD-MJ will be Class A, MK-MZ for Class B.
The new Novice versions of the Class A and B licences will use the prefix "2" instead of "M", ie 2A2AAA or 2K3AAA, etc.
The DTI are proposing to allow certain club stations to send greetings (third-party) messages. This will be indicated by present G
club prefixes being changed to GX for clubs having this privilege, and GM to GS, GW to GC, etc. Note that use of the new call is only mandatory for periods during which greetings messages are being sent.
.... etc ....

Who said that the American callsign scheme is complicated ??????

What a coincidence that this subject is being kicked around just now! I'm planning to do something similar around here. I plan on putting an ATV transmitter on a local tall building (I live VERY close to the beach) so that I can watch the ships go by :-). I'm also planning on using 427.25 as the video carrier so that I can receive these pictures on channel 58 on my cable ready TV (and VCR) without the need for a converter. Right now I plan on trying out the KPA5-E 1 watt transmitter. This should give me reasonable picture quality without QRM'ing anyone else. I also want to have an onboard touch tone (tm) decoder so that I can turn the xmitter on/off, pan left/right/up/down, zoom in/out, etc. If you're interested in where I live (to see if you can receive this) look at my ICBM coordinates in my .sig - they're correct. If there's any local interest from the local hams, I may try and boost the transmitter power so that others could receive it. Any help from experienced ATV'ers is more than welcome - so are suggestions from the peanut gallery.

RHAREL%FAB8@SC.INTEL.COM ("RICHARD HAREL CAL.LAB INTEL") writes...
>Can anyone give me some feedback as to what speeds data transfer is
>achieving these days over:
>a. Conventional Telephone lines

Given a 30 dB S/N ratio and 2.6 kHz usable bandwidth, Shannon says you get about 26000 bps LIMIT (theoretical, not achievable) of modem technology. Contemporary voiceband dial-up modems (V.32) get 9600 bps but send and receive over the same wire. Private line modems go up to 19200 bps. Not bad. Compare that to your average TNC.

>b. Leased data lines

Telco will sell you a DS3 circuit at 44.7 Mbps. Over glass, of course. Copper typically goes to 1.544 Mbps (US) or 2.048 Mbps (Europe).

>c. RF (mainly microwave)

Northern Telecom has announced a radio (using 512QAM modulation, not simple stuff) running at 4 or 11 GHz with a bit rate of about 310 Mbps. I think the channel bandwidth is about 70 MHz, maybe smaller. Compare that to your average TNC! With 16PSK, though, 3 bits/Hz is common.

>Is anyone doing some experiments out there digitizing voice and then
>transferring it at high speeds via RF ???

RF is inherently an analog medium; digital radio is quite practical but tends to cost a bit to get started in, plus eats fair dinkum bandwidth. The telcos use quite a bit of it. Digital cellular radio is also coming; hams are as usual on the trailing edge of the technology. (But hey, we make great keyers!)

It's probably not legal for hams here in Gringonia, since the ARRL went ape-chara a decade or so ago when the FCC said they'd rather regulate bandwidth than emission types. The ARRL said, basically, "SPARK FOREVER" and so you can't just run any narrow mode on the ham bands here in W/K/N land if you want to stay legal.

Phil Karn asks "how come the hams who rise to prominent national positions always seem to be right wing extremists?"

Maybe all those folk in the middle prefer them to left-wing extremists :)

General LeMay put together the most awesome air strike force ever known. For more than 40 years this force, the Strategic Air Command, has managed to conduct thousands of operations involving nuclear weapons without ONCE ever having a serious mishap. Under LeMay's guidance, the most knowledgeable highly disciplined, and competent military force ever assembled has been THE most effective deterrent to global warefare. The B36 bomber was the first global bomber. Its very existence provided the psychological reason to think twice about any subsequent (to Pearl Harbor) attack on the U.S. When the B36 became to low and slow, there followed the B47 and B52. The B58, first supersonic hi-altitude bomber was "un-defendable" during its day and so, also, was an effective deterrent.

Except for the B52, which was used in the Viet Nam war, NONE of these ever fired (excuse me) dropped a weapon in anger. I believe that this stands in obvious testimony of his dream (yes, "right wing extremists" have dreams of peace too). It is no accident that the sign (humorously portrayed in Dr. Strangelove) "PEACE IS OUR PROFESSION" stands proudly at the entrance to every SAC base. Class dismissed.....

You know, I've heard my mother gripe about the same thing! Seems that
W3WKD had better things to do (like raising 2 kids) than increase her
code speed. She holds the Advanced class, but feels cheated!

She still maintains that her "Class A" license was the tops and that she
finished the test 1/2 hour ahead of W3WJK,(her husband, my dad) who
got the alphabetically-early call due to the "first-in/last-out"
phenomenon of stacking your test in the examiner's in-basket!

She also likes to complain that she had to draw the circuits on the test
NOT just pick multiple choice.

Yea, I'm not sure what gripes her more: Insentive licensing or my Dad's
call. ;-)

Well, I took the liberty of re-posting the entire article since I understand that
news articles with very long lines can get truncated. I hope nobody minds!

Anyway, I'll drop in my $.02 worth...

First, to Sylvan: How about posting a summary of what you have gotten so far?

I wonder about having a 'negative multiplier' for the more power you run, or other
factors which increase your ability to make contacts? Not something which will
totally negate the improvements, but which will at least level out the playing
field a bit! Either that or limit total power to 200 watts. Why put novices
and techs at a disadvantage? (Is that part of the reason for the 'novice
roundup' contest (is that the name?), to give novices and techs someone
to talk to?) That way, skill will play a little bigger part.

I don't suppose 'official observers' (:-) would work as a means of watching for
those who do not id? How about allowing people involved to send in a list
of those who were not obeying the rules (whatever they may be), and then using
some kind of filter (minimum number of complaints, whatever) to weed out the
false reports?

Well, enough stream-of-consciousness rambling for now, lets have somebody who
knows what they are talking about post something USEFUL!!!!! :-)

Well, if you were not on HF last weekend, you really missed out!

As 'usual' (or at least, as 'usual' as I can make things be), I was on at the 'usual' time trying to do the un-net. Well, let me tell you, when I heard DZ's and ML's and all that good stuff calling CQ, I'm afraid I never got around to calling cq for the unnet, my apologies (I even heard one 'rare DX' person calling CQ and NOT GETTING ANSWERED!!!!! Too bad he could not copy me when I replied - he could tell I was there and that was it...)

Anyway, I logged 2 German stations, and one Lithuanian on 10 meters last saturday! My first European station!!!!

Anyway, if you've got an HF rig, and you weren't on last Saturday, well, you really missed out.

(All this with about 100 watts into a 5/8 wave groundplane mounted about 30 feet off the ground! ON SSB!)

(Editors note: please excuse my excitement, but I never thought I'd ever work "real dx" until I upgraded and had 'real power', or switched to CW, or a 'real antenna', or .....)

(Claimer: editor == me) :-)

Which reminds me - I had an email message a while back which said that I should not work HF SSB because it would ruin my upgrading. Not so! Making contacts on HF only makes me fear the time when 10m becomes a local-only band... No way do I want to be a Tech when the sunspots change! This is too much fun!

Yea, me too. Spoils your whole day!

When I was a kid, a neighbor came over and started screaming at my mom
about how my dad was tearing up his TV reception. She tried to explain
that my dad wasn't even home, but he wouldn't listen. He just kept
screaming -- until dad pulled into the driveway! One embarrased
neighbor! Turns out that his other neighbor was fixing up the basement
with a powersaw.

>in getting the Air Force to switch to SSB. Needless to say, this led to Collins
>selling the government million$ in KWM-2's and 30L's.

That clinches it, Turgidson == LeMay. From Dr. Strangelove:

General Turgidson:
"If you'll recall, sir, one of the provisions of Plan R provides that once the, uh, go code is received, the normal SSB radios in the aircraft are switched into a special code device which I believe is designated as CRM-114..."

I'm still waiting for a CRM-114 to show up at the Dayton fleamarket. I've seen the B-52s in the Puma Air Museum (Tucson AZ) and the Air Force Museum (Dayton OH) but unfortunately they seem to have been gutted of all their electronics. :-)

As far as LeMay goes, read this quote from p280 in "War and Peace in the Nuclear Age" (ISBN 0-394-56217-8). In all seriousness, it's one of the most chilling things I have ever read.

"In September 1957, LeMay briefed two visiting members of Eisenhower's Gaither Committee: Robert C. Sprague, an electronics manufacturer who had also served on the Killian panel, and Jerome Weisner, who became Kennedy's science adviser and later president of MIT. Sprague noted a wall chart showing the response time of SAC's bombers; it seemed to suggest that none of them would get off the ground by the time Soviet bombers were picked up by the early warning network in Canada. Sprague and Wiesner each recalls LeMay affirming that view but adding: 'I will know from my own intelligence whether or not the Russians are massing their planes...for a massive attack against the United States.' And he said, 'If I come to that conclusion, I'm going to knock the shit out of them before they get off the ground.'"

"'General, that isn't national policy,' Sprague remembers saying. 'You know that.' LeMay, he says, replied, 'No, it's not national policy, but it's my policy.'"

I submit this as further evidence that having passed a code test doesn't necessarily make one more likely to accept government rules and regulations. :-)

Phil

1741. Re: NPRM 90-55 - No test code

%domestic HF privileges. The international code test requirement does
%not apply to domestic communications. Two simple solutions come to
%my mind:
%
% 1. give the Communicator class all the present Novice/Technician HF
% privileges, but restricted to domestic communications only.
%
% 2. require Communicator class applicants to pass the General class
% written exam, and give them all General class privileges,
% but restricted to only domestic communications on HF.
%
%I prefer option 2, but option 1 is the least we can do, as I see it.

Sure, how do you police it? Remember that CB was supposed to be
"domestic communication only" and "line of sight" only. Now you can
hear just as good DX on 11 metres as you can on 20!

Just a personal opinion but if children of 7 years of age, and people
of 75 years of age can learn International code at 10 wpm (the current
Canadian requirement for HF priviledges) then I don't see how anyone
can not learn it at 5 wpm! A lot of the trouble is that people just
don't want to be told you *have* to do something. Just an opinion.

BTW, I am not an objector to a no-code intro level licence, there is a
VHF only n0-code going into effect here next September and I think it
will be a benefit to the hobby but I can see all sorts of problems with
a no-code HF licence.

To: jneher@tenorman.Sun.COM (Jonathan Neher X62863)

S6Does anybody have a recommendation for a qsl card
S6maker? I just got my ticket and have already started
S6receiving some from others so I guess I need to get some
S6soon. I've seen some little adds in the magazines, but
S6I'm looking for personal recommendations.

Well, for price/quality/value I'd go with W4MPY's cards. The quality
is good, the price is reasonable. The quality/price ratio is also good
for K2RPZ Print. There is also an excellent printer in the UK but with
the cost of the pound and shipping it isn't worth it any more.

Personally, I use my local printer. I looked through my cards and
found a reasonable design, took it to him and he made up a proof
before printing it and the cost was better than anything I could mail
order.

Hope it helps!

To: XB.P07@forsythe.stanford.edu (Bryan Pfaffenberger)
Subj: Ham Operator Profile

Bryan,

Interesting as I did something similar during my undergrad work in social psychology.

>a) What are the distinctive social values of ham radio people? Do
>they tend to prefer hierarchical or egalitarian group structures?

Generally, groups within the hobby (clubs etc) are egalitarian structures. There is a minor heirarchy in the sense that those in the hobby longer tend to find themselves in a "mentor" capacity on occasion. Special groups such as those involved directly in emergency public service work have a more heirarchical structure but this is more of a necessity imposed by function than desire (although like any group of people hams are not immune from the desire to be boss <grin>).

>b) How to ham radio people relate to technology? Is there a
>sharing ethic like one finds in computer user's groups?

Many computer users groups started as groups of ham operators. The local commodore group is a public spinoff of the local radio club's user group - the first in our area. The sharing ethic is very evident in the hobby in general. Many advances in technology in the past and in the present have come from hams, either through their hobby or their jobs. Many are engineers, technicians and technologists. Many are involved in aerospace and have had a major impact on sattelite research.

>c) What are the ideals of social service that ham radio people
>espouse? Is involvement with the technology supposed to serve some
>greater good than just amusing oneself with a fascinating and
>rewarding hobby?

This question will elicit many responses. The old premise underlying the hobby was one of providing experimentation and developement in radio related fields and in providing a trained and knowledgeable cadre of radio operators in times of emergency. While much of the experimentation has been diluted for many hams there are many more who enjoy developing new applications and uses for the technology available. Most operators are willing to help out in emergencies and public service and many go out of their way to do so.

>Sorry for the naivete of these questions! But that's what makes
>good anthropology--you're brave enough to ask dumb questions. Will
>appreciate all responses.

Not naive at all for those not involved with the hobby. Most of us
love to sit and talk be it about ham radio or anything else and you
are likely to get many responses of varying nature.

The above opinions are those of myself and many friends I have met
both personally and on the air over the years. There are differing
opinions on some points, especially whether or not we serve some
greater good, but this is the nature of man.

>"To the degree that he masters his tools, he invests the world with
>his meaning; to the degree that he is mastered by his tools, the
>shape of the tool determines his own self-image." Ivan Illich

It could be said the above applies to ham radio operators, a very apt
quote Bryan.

Hope to chat on the air someday.

We traded messages earlier on HAMLICEN about type-acceptance and the Canadian plan. If I understand the latter correctly, it does not require type-acceptance, just commercial manufacture. That's not radically different from the present de facto situation. The Canadian plan just makes it de jure. And "commercial manufacture" could be extrapolated to include kits.

After the inevitable German (re-) unification, what will happen to German Amateur radio?

I am curious about how callsigns will be handled? Will amateurs in the GDR want FRG callsigns to hide that they are in the East? Will they want to keep their GDR callsigns? What about new callsigns; how will they be allocated?

How will the licensing structures be affected? (What exactly are the licensing structures currently?) Will an entirely new licensing structure be set up, or will the existing structures somehow be merged?

A quick comment:
I strongly suggest starting out learning the code at 20+ wpm. It is
so much easier to go from 0 up, then to improve late (IMHO). Remember,
that you can always test multiple times throughout your learning
getting 5, or 13 along the way. I find the learning process is a part of
the problem, so keep going while you're psyched up to learn. That applies
to theory as well. Go for an extra whether you need it or not, it's
easier to do it while you're studying anyway.

Ok, I give up. I'll cry uncle. I've been totally unable to get packet radio to stay up long enough from my QTH to gather in an article which I could really use. I promised the Novice class that meets each Wednesday evening (today is Tuesday) that I'd bring in the VE schedule for New England to the next class, so that they will know who to contact if they wish to upgrade from Novice....

That was two weeks ago when I made the promise. Since then, I've been trying to get onto packet and get the list....I even know the article number on the Bulletin Board WA1PHY (out of Bedford, Mass.): it's 5224. BUT, my rig seems to be totally unreliable. While I can connect to it (via a digipeater in Fitchburg, Mass.), I can sometimes get the banner, and I can sometimes see SOME of the mail that is sitting there for me to read (I know there are at least four packet mail for me.....but I can't read them....), I never get the prompt. It always times out before then.

Meanwhile, I still need the VE Schedule for New England (ie, Central Mass and Southern New Hampshire). Is there some kind soul out there who can get this data off the packet radio and email it to me instead? (At least email is reliable.....:-(

Thanks in advance.

Frustrated packet user (ps, I can successfully connect and receive CAP packets in Wakefield....why can't I receive HAM packets in Bedford????????)

>seem to have been gutted of all their electronics. :-)

You'll have to beat me to it!! A friend who was in the USAF says it's
a real device, and the control head (shown in the movie) is not
classified. They have been seen on the surplus market, and Dayton is
probably a good place to look, what with Wright-Patterson AFB nearby.
CRM-114 isn't its real name; the CRM prefix would mean "air-
transportable radio maintenance." A "CRM-114" label appears among the
equipment in the first scene of _Back to the Future_. I named the
LORAN-C receiver in my car "CRM-114" and one of its waypoints is FGD135.

Maj. King Kong:
"To insure that the enemy cannot monitor voice transmission or
plant false transmission, the CRM-114 is to be switched into all
receiver circuits. The emergency base code prefix is to be set
on the dials of the CRM. This'll block any transmission other
than those preceded by a code prefix. Stand by to set code
prefix... Set code prefix... Lock code prefix... Test auto-
destruct circuit... Switch all receivers to CRM
discriminator...."

Sometimes I recite that while taxiing out to the runway in a
mighty Cessna 172 and setting the transponder. :^)

To: Orig_To! wsmr-simtel20.army.mil, BRUCEH
CC:
Subj: Laser Diodes

Thanks to Dave for his reply. I've gotten a little more info. since my posting. There are several places to buy the visible laser diodes, but everyones prices are HIGH! The cheapest i've seen is $113.00! The following is a list of part numbers, manufacturers, etc.

Toshiba TOLD-9200 (price about $165.00)
Toshiba 9201 gain guided (price about $113.00)
Toshiba 9211 index guided (much better diode) price about $131.00

NEC NDL-3200 (i don't have any more info)

Marshal Electronics of Huntsville (205-881-9235) has the 9201 and 9211 in stock at the above prices. I don't know anymore about them except that they have the diodes!

From talking to people and reading, I have gathered that the diode itself needs to be used with some type of collimator to get what we think of as a beam of laser light. There are several companies that offer an entire assembly with battery pack, etc. for $300-$500. If anyone is interested in this, drop me some e-mail. These diodes look to be interesting and useful, but i'll wait until the price drops. Most all of them operate in the 670 nm range, but that is dropping towards the 620 range (where the standard HeNe laser operates, i think).

1751. anyone know about "litz wire"?

Newsgroup: rec.ham-radio
Date: 1990-03-20 17:51:06 UTC
From: beale@sierra.Stanford.EDU
Message-ID: <579@sierra.stanford.edu>
Source record: 12706

A colleague of mine is interested in finding out about litz wire-
past and present manufacturers, performance data (specifically
attenuation versus frequency, eg from skin effect in an antenna
application), and from whom any might be available today.
I gather that Litz wire is a bundle of finely stranded wires with
each strand insulated from the others, thus having lower losses at
very high frequencies than solid wire with the same cross section,
assuming the skin depth is smaller than the radius of the wire.
I understand that this stuff was often used in low-loss inductors
and the circularly-wound indoor antennas found on early BC-band radio
receivers. It seems to be hard to find mention of it these days,
though, although the laws of physics haven't changed in 50 years and
whatever advantages it had then should still apply. Perhaps the
nuisance value of soldering all those little strands together was the
problem; I don't know.

Anyway, if you have a current source for the stuff, I'd appreciate
hearing from you! -- N8JUF beale@sierra.stanford.edu --

1752. Electromagnetic Fields

From: epicb!david@uunet.uu.net (David Cook)

Ok all you electromagnetic fiends... read the book CURRENTS OF DEATH...

Date: 19 Mar 90 18:27:47 GMT
From: optilink!elliott@uunet.uu.net (Paul Elliott x225)

The June 12, 1989 issue of _New_Yorker_ began a series called
"Annals of Radiation", the first subtitled "The Hazards of Electromagnetic
Fields".

The New Yorker published a serialized version of the book. In other words,
these are the same material by the same author, Paul Brodeur.

The _New_Yorker_ is obviously not a prime scientific source, and I would like
to see a rebuttal or follow-up (perhaps in the later issues?... haven't seen
them).

There was a "rebuttal" in Forbes in about August or September. It
wasn't worth reading - it was just a flame.

Anyway, read them if you get the chance.

I agree that it's well worth reading. It's easy to either believe
it and get scared, or dismiss it as paranoid. It's much harder
(but more valuable) to read it analytically and discover what your own
prejudices are. I don't know of any other books on this material; one
could check out Brodeur's bibliography if one were sufficiently motivated.

I believe Brodeur also wrote the article in the New Yorker a few years ago
on the relationship between low-level microwave exposure and cataracts.
Again, the emphasis was on the "Oh, that can't possibly happen" attitude
of organizations like the Air Force.

1753. ARRL file format for contest log submissions

Newsgroup: rec.ham-radio
Date: 1990-03-20 19:01:00 UTC
From: RJA%UTRC@UTRCGW.UTC.COM
Message-ID: <9003210804.AA11730@ucbvax.Berkeley.EDU>
Source record: 12729

ARRL FILE FORMAT FOR CONTEST LOG SUBMISSIONS

Rich Assarabowski K1CC
Chairman, ARRL Contest Advisory Committee

The ARRL Contest Advisory Committee has adopted a set of guidelines
for submitting log entries on diskette. A suggested ASCII file format was
initially proposed by the CAC and the ARRL Contest Branch at the beginning
of this year. It was distributed within the CAC and among contest
software developers for comment. Considerable discussion took place
regarding the merits of binary vs. ASCII files, with software developers
tending to support binary file formats. The feeling of the CAC was that
although binary files are indeed more efficient, they would be more difficult
to generate for the average user. This would tend to discourage rather
than encourage submissions on diskette. An ASCII file format was therefore
adopted for submitting logs in diskette in lieu of paper logs. Since the
ARRL Contest Branch uses binary file formats in its log processing software,
it will convert the submitted ASCII files into its own binary format. However,
the Contest Branch has agreed to work with any software developer who wishes to
generate a binary output which could be directly read in by the ARRL
log checking software. Several software developers (K1EA, KY1H and K8CC)
have already agreed to produce an ARRL binary format option within their
programs and will be providing this option in future releases of their
software. Contest logs can be submitted in ARRL binary format from those
developers who provide this option. Software developers can contact the
ARRL Contest Branch for details.

The ARRL Contest Branch for some time now has been working on a set
of computer programs for contest log processing. The objective of this
effort is to improve the log checking capability and the accuracy of
results, and at the same time to reduce the time involved in processing,
scoring and verifying submitted logs, both paper and disk-based. It must
be strongly emphasized that paper logs will be scrutinized at least as
carefully as computer-generated logs (if not more so!). Log submissions
not adhering to these guidelines will still be accepted (such as logs
duped post-contest without any time, band or exchange information),
however, they must be accompanied by a paper log containing the required
QSO data.

The guidelines below were revised a number of times and are the
result of considerable thought and discussion. We originally developed a
fixed-field ASCII file format with very strict requirements regarding data
sequence, justification and field definitions. However, we subsequently
relaxed these requirements, in order to make it simpler and less
error-prone, without too much additional effort on the part of the Contest

Branch. Any contest logging program should be able to produce an ASCII output following these guidelines without much difficulty. Almost all commercial database and spreadsheet software provides an ASCII output file option.

We have initially decided to limit the log submissions to IBM PC or compatible (MS-DOS) disks. If there is enough demand in the future for other computers (Commodore, Apple, etc.), the ARRL Contest Branch will consider accepting those as well. It is also possible to submit logs to the ARRL Contest Branch via modem, preferably for smaller logs and for those who cannot create an MS-DOS disk. The ARRL bulletin board is available 24 hours and is currently on line. The telephone number is (203) 665-0090, using 300, 1200 or 2400 baud (No parity, 8 bits, 1 stop bit). Please follow the same file format as for disk submissions, and be sure to send in your paper summary sheet via the mail.

Finally, the CQ Contest Committee has agreed to accept the ARRL ASCII format as a standard as well, and will encourage submissions in that format. Other formats will be accepted but must be accompanied by a paper log. The ARRL Contest Branch will be working with the CQ Committee in maintaining a unique call sign database and in sharing their log checking methodologies.

SUGGESTED STANDARD FILE FORMAT FOR SUBMISSION
OF ARRL CONTEST LOG DATA

1. All files must be in standard ASCII format.

2. All files must be on an MS-DOS formatted disk, 3.5 inch (720K or 1.44 MB) or 5 1/4" (360K or 1.2 MB).

3. A diskette label should clearly indicate the call used, contest name, entry class and date of the contest.

4. The log file must consist of one line of data per QSO, without headers, footers, page breaks or other non-ASCII characters.

5. All QSO data must appear in each line, aligned by column, and must include the following:

BAND - Wavelength for HF (10,15,20,...) and frequency for VHF
MODE - PH, CW, RTTY, etc.
DATE - In MM/DD/YY or DD/MM/YY format
TIME - 4-digit UTC (without colons)
CALL - Call sign of station worked (allow 15 columns)
SENT - Complete exchange sent
RECEIVED - Complete exchange received
MULTS - Indication of multipliers, either a symbol, sequential number of multiplier or section/prefix/zone, etc.
POINTS - ALL unclaimed QSO's must be "0" points
STATION - Entries in the multi-operator, two-transmitter (Multi-2) class in the ARRL International DX Contest or any contest in which two different station logs are merged must

indicate which transmitter made which QSO's.

6. The log data file name shall consist of the call sign and the extension ".LOG", for example, K1CC.LOG.

7. State abbreviations must be standard US Postal Service two-letter abbreviations, ARRL section abbreviations must be those appearing on the ARRL summary sheet for that particular contest.

8. A paper summary sheet is required of all logs, either an official ARRL summary sheet or a close facsimile with a signed contest participation disclaimer.

8. All diskettes become the property of the ARRL and are not returnable.

1754. DXCC Country List

Newsgroup: rec.ham-radio
Date: 1990-03-20 19:28:25 UTC
From: wmb@ulysses.att.com
Message-ID: <12705@ulysses.att.com>
Source record: 12709

The current ARRL DXCC country list follows. Changes from the
previous posting (2/89) include the addition of several new
countries (T33, ZS9, 3D2 (Conway)), prefix changes (KC6 -> V6,
KX6 -> V7, UA1 -> 4K2, UP -> LY, UQ -> YL, UR -> ES, ZS2 -> ZS8,
3D6 -> 3DA) and other minor modifications.

Much of the information was provided by Ron McConnell, W2IOL.

The colon-separated fields are:

1. primary amateur prefix ("*" suffix for deleted countries)
2. country name
3. continent
4. ITU zone(s)
5. CQ zone(s)
6. time zone (hours from UTC)
7. latitude
8. longitude
9. ITU prefix allocation(s) ("~" suffix for unofficial)
10. other amateur prefixes

Please mail corrections and suggestions to me.

>>> Re unable to find SIMTEL20s pd1 disk

The procedure I use (and it works :-) is:

ftp 26.2.0.74 - connect to SIMTEL20

user anonymous - Now inside FTP
yourname - in reply to the password prompt

dir - (or ls) this will show you the files
at the top level.

cd pd1:<msdos.hamradio> - change to the HAMRADIO directory on pd1

dir - see what's there
- there's a file called 00-index.txt
which is an ascii file of one line descriptions

get 00-index.txt - ignore the semicolons and the numbers after
the filenames (probably version numbers)
THIS IS AN ASCII transfer (default mode),
OK 'cause it's text

tenex - Tell simtel to transfer BINARY files
DON'T use the BINARY command - it appears to work
but a 128K file expanded to 178K. Use binary
when transferring from UNIX/VMS machines.

get sm309.arc - get SUPERMORSE - it's an ARC file, must be in
TENEX mode.

get xxx.arc - the mode stays in TENEX until you give the ASCII
command.

quit - close connection & exit ftp

If the your path is a bit slow, type HASH before doing any GETs, it will print
a # after each 1000 or so character, just to let you know how it's going.

As I remember, there's some intro documentation at the top level.

Hope this helps,

Giovanni ZL2BOI

Re: This OM needs help !

This guy might be one of those people who simply cannot learn code. I've seen it before.

While I'm not a VE, the guys I've taken tests from wouldn't mind the verbatim dot-dash copy and translation. I suggest that the OM write it down like this: |...| This takes less horizontal space on the paper, so less time is spent on the carraige-return. Also, if the OM understands binary trees, that is a good way to memorize Morse Code. In this scheme, 0=dit, 1=dah. Make up a balanced btree, assigning dits and dahs, then create a silly saying to remember the tree.

I don't have the sked for all NE but

Exams for all class of Amateur License are given every month at MIT in
Cambridge MA.

They are given on the Wednesday evening before the last Wed. of every
month at 7:30 PM in Room 1-150. Walk ins are acepted as long as room is available.
Bring a photo copy of your present license if any, 2 forms of photo ID,
$4.95 in cash, and a completed form 610 (available from the FCC in
Quency MA) For more info contact Nick at 617 253 3776.

MIT's entrance is located at 77 Mass Ave and posters should lead the way
to room 1-150. Ample free parking is available in the evenings.

> Canadian requirement for HF priviledges) then I don't see how anyone
> can not learn it at 5 wpm! A lot of the trouble is that people just
> don't want to be told you *have* to do something. Just an opinion.

Here is an example of statements which are truthful, but by virtue of
their incompleteness, can be misleading.

The statement about people of 7 and 75 learning code is not complete.
There is no evidence that this capability is existant in 100% of the
population at 7, 75, or anywhere in between. Sure, many people at these
extreme ages can and do learn code. It is a safe assumption that many,
and quite possibly many more, people in between can and do learn code.
No one can truthfully say that everyone can learn code.

The opinion that people don't want to learn what they are told to learn
is also not complete. While some may not want to just for that very reason
alone, many others do not want to IN CONJUNCTION with the fact that they
know that learning code is not going to help them in what they happen to
be interested in doing. Some people don't like being told that they have
to learn something they know they are not going to use and will do them no
good. This does not apply to everyone, because not everyone falls into the
category of "will not be using code"; but some people are in this category.

Further, because hams have (and certainly at least in the past this has
been MOST hams) wanted everyone to pass a code test to "get in", the
"outsiders" who were interested in other things looked upon the hams, and
the amateur radio service itself, as having an "attitude problem".
Probably everyone has an attitude "problem", but some of us are just not
making much of an effort to get along with those who have a DIFFERENT
attitude problem.

> BTW, I am not an objector to a no-code intro level licence, there is a
> VHF only n0-code going into effect here next September and I think it
> will be a benefit to the hobby but I can see all sorts of problems with
> a no-code HF licence.
>
> 73, Dean VE1CBF

From my understanding, the Canadian restructuring does not involve any
no-code HF license class. Unless and until such a thing is proposed,
you should not have too much to worry about. In fact, something very
close to the Canadian system is being discussed by some as a possible
structure for the United States (it even has the correct number of
classes for the FCC computer system).

1767. Satelite data link info WANTED

Newsgroup: rec.ham-radio
Date: 1990-03-21 07:04:32 UTC
From: w1gsl@athena.mit.edu
Message-ID: <1990Mar21.070432.11914@athena.mit.edu>
Source record: 12725

I am looking to set up a data link, probably full duplex, between a high altitude ultra long duration atmospheric research aircraft and a ground station.

On the order of 4800 bits per second of data is to be transfered. Both telemetry and control is being communicated so the transfer must be real time. (well almost)

Over most of the proposed flight paths any number of synchronous comm sats would be visible to both aircraft and the ground control.

** What is the availability of low bandwidth transponder channnels, who rents them out, how much do they cost?

** Who makes the "ground" stations? Light weight and an omni directional nontracking antenna for the aircraft would be a big plus.

** What are the coverage areas of the satellite receivers? Are their footprints only aimed at land areas?

Thanks in advance.

Thanks! You said it more eloquently than I ever could. Unfortunately, you
did leave out the incident where they dropped a couple of unarmed (obviously)
H-bombs either on Spain or just off the coast back in the late 60's (details
escape me at the moment, please don't flame). To this day, that's one of the
big reasons the Spanish don't like our bases there.

>Except for the B52, which was used in the Viet Nam war, NONE of these ever
>fired (excuse me) dropped a weapon in anger. I believe that this stands
>in obvious testimony of his dream (yes, "right wing extremists" have dreams
>of peace too). It is no accident that the sign (humorously portrayed in

>Dube Todd N5PDK

We sometimes used the "Peace is our Profession" motto on the Griffiss AFB
(416 BMW (H) (SAC)) club repeater (WA2ZXS) whenever we'd manually ID the

thing (e.g., one of the club members would grab the local mike of the repeater and blurt it out, usually during club meetings).

See, I knew I could get this post around to ham radio eventually :-).

Uh, I wouldn't be so definite. In the back of the fascinating book "US Nuclear Weapons" by Chuck Hansen (1988, Orion Books, ISBN 0-517-56740-7) is a list of "Broken Arrow" incidents (accidents involving nuclear weapons). Hansen described 32 in the period 1950-1980. Most of the accidents involved aircraft, including the famous incident off the coast of Spain in 1966 when a B-52 carrying four MK28RI bombs (with rated yields as high as 1.45 megatons each) collided with a tanker during an in-flight refueling operation. The bombs in this particular case were recovered. But if the descriptions of some of the other incidents can be believed, there is more than one nuclear weapon sitting on the ocean floor, waiting to be discovered someday. (Sounds like an idea for a novel...)

The author added a footnote explaining that other, additional accidents still remain classified. One can only wonder what THEY involved.

I can highly recommend this book to anyone with an interest in the history of nuclear weapons. It's not a literary epic like Rhodes' "The Making of the Atomic Bomb", but he picks up where Rhodes left off (the development of thermonuclear weapons). The book contains a LOT of technical details, including those the government tried to keep a magazine from publishing in 1979.

By the way (just to relate this somehow to ham radio) if you are going to Dayton this year, consider going a day early and spending a day at the US Air Force Museum at Wright Patterson Air Force Base. Scattered among the many airplanes are quite a few nuclear weapons (okay, weapon *cases*) including Little Boy and Fat Man. Somehow, seeing them "in the flesh" made the arms race and the potential of nuclear war suddenly seem a lot less abstract to me.

1771. Global Positioning System status report on WWV/WWVH

Newsgroup: rec.ham-radio
Date: 1990-03-21 13:40:35 UTC
From: LANG@UNB.CA
Message-ID: <ID6323.D900321.T094036.LANG@UNB.CA>
Source record: 12718

Yesterday WWV (and presumably) WWVH began broadcasting reports on the status of the Global Positioning System. The WWV broadcast is at 14 minutes past the hour and is repeated during the following minute. The Omega navigation system status report continues to be broadcast at 16 minutes past the hour. Although I have not heard it yet, I imagine that the GPS report on WWVH is given at 45 and 46 minutes past the hour just before the Omega report at 47 minutes past. Can someone confirm this?

By the way, WWV was predicting a major geomagnetic storm for today. Anyone notice any effects on SW?

>maker?

I got mine from a place in Texas... Lets see, 'The best printshop in Texas'? Anyway, the expression 'He is a ham' definately has two meanings with them :-).

My major reasons for choosing them were: they were pretty fast, and pretty cheap. They had some real nice-looking cards, but my card budget is not where I would like it... In any case, I'm relatively satisfied, except that I felt that the printing was not quite as dark as I had expected. Not bad, but not quite as thick on the printing as I had expected from the samples. (but that may be because of my choice of colors...) Bottom line - cheap, pretty fast delivery, not bad quality. If thats what you are looking for, you might want to check them out. If I've got the name wrong, and you cannot find a print shop in Texas with a cute name by looking through QST, email me and I'll look it up.

Source record: 12721

Actually, Litz wire is probably more commonly available now than it was a couple decades back. There has been a LOT of interest in it in audiophile circles. Many of the high-priced interconnects are made with Litz wire, and many audiophile equipment-builders use it for internal wiring of components or modifications to factory gear.

Unfortunately, it doesn't seem to be easily located. I'm sure that's why you posted the query. I just checked 4 of the major electronic-distributor thick catalogs and couldn't find "Litz wire" or ("Litz" listed under the "wire" or "cable" categories) in their indices. I bet these people DO sell the stuff; it just is listed under some other name or terminology.

Somewhere around the house I have a catalog with a batch of samples of Litz wire from some vendor; if I find it I will post the source. I suggest you post a copy of your inquiry on the USENET "audio" group, if you have USENET access, or mail a query to "info-high-audio@csd4.csd.uwm.edu" (the high-end audio mailing list); there are audio-gear builders there who might have info on current Litz wire sources at their fingertips.

> a no-code HF licence.

When ham radio began, CW is ALL THERE WAS. It made some sense then
to require proficiency in CW to "get on the air".
CW, now, is just a novely mode - with the exception of truly
week signal communications. Therefore there is no reason why
proficiency in CW should be a requirement to obtain a ham
license; considering that many people never use it again, and it
is just an unwarranted stumbling block to many technically
inclined persons who could and would "advance the state of the art"
in the many other areas of radio communications - Frequency
compaction, Microwaves, Software.. etc. These things didn't even
exist when ham radio began. We are losing the benefit of
their contributions by maintaining an archaic, hand-eye coordination
skill, as a requirement for gaining access to a, now, multi-faceted
technical hobby. Computers and bulletin boards are where all the
modern day potential hams practice a hobby, now.

I maintain that to use the airwaves, and gain access to this
great hobby, there should be only a few requirements. The individual
should be aware of the rules and frequency allocations. They should
have enough technical knowledge to properly operate their equipment
and be able to solve interference problems if they arise. Maybe a
sound introduction to curteous operation would also be in order -
and that's it.

Let's open up the hobby so more people can take advantage of the
opportunities and by so doing, increase the strength of amateur
radio and increase public technical knowledge.

>Bring a photo copy of your present license if any, 2 forms of photo ID,
^^^^^^^^^^^^^^^^^^^

This is off the original subject by far, but the above caught my eye.
Does the average person these days *have* 2 photo IDs?
-
I guess all drivers licenses these days have photos; at least mine does (Missouri). But the only other photo ID I have is my workplace badge. That's because it is a military organization. I know many of my friends who work in other fields, such as teachers and assorted private industry jobs, have no such badges issued to them. Do most school/college ID cards now have photos? (They didn't when I went to school in the '60's.)

I'm guessing many non-drivers may not have *any* photo ID. I guess you can always go to one of those outfits that sells photo-ID cards, but they are of course worthless as real ID.

Does this requirement cause any problems? Anybody else out there have comments on the issue of photo-ID?

1779. "Currents of Death" - Followup

Newsgroup: rec.ham-radio
Date: 1990-03-21 17:00:17 UTC
From: john@anasaz.UUCP
Message-ID: <1478@anasaz.UUCP>
Source record: 12727
Cross-posted to: sci.med,sci.electronics,rec.ham-radio

I recently posted a request for information about the effects of ELF electromagnetic fields on health. This was triggered by a cancer cluster in Santa Barbara, CA and Paul Brodeur's book "Currents of Death." I got surprisingly few responses, but they were quite useful, so I thought I would post them for the net.

First, a summary. Currents of Death is a very sensational book by Paul Brodeur which alleges serious health effects from low frequency, low level electromagnetic fields, such as caused by power distribution or CRT sweep circuitry. I was basically very skeptical because of the tone of the book, and the difficulty of explaining biological effects of signals that are way below the thermal noise level in tissue.

One poster referred me to a book review in the April, '90 Scientific American. This review (4 pages long) gives a very good introduction to the controversy. It also refers to an OTA document (which I plan to order) for more information. The gist of the review is that the book does a disservice due to its sensationalism, but that there is enough evidence of biological effects that more research and some prudent concern is warranted.

I also received a call from Abraham Liboff, one of the researchers mentioned in the book. He said that he and others have done a lot of research which shows biological effects of ELF (extremely low frequency) magnetic fields. His research is in the area of ion transport. He has seen "profound effects" in some experiments. He said that there is as yet no good theory as to the mechanism of the effects - a "delicious scientific problem" is how he termed it. Basically the problem is that the effects of the low level magnetic fields are very small compared to thermal effects (kT noise) and thus its hard to come up with a mechanism that will allow the magnetic field to have a net effect. He did mention another researcher (sorry, didn't write down the name) who has done stochastic modelling under those conditions that did show some net effect. He also stated that he felt that higher frequency signals would probably not cause problems (due to their great attenuation when penetrating the body), and that small electric fields would have no effect. This is not surprising, since the body is a pretty good conductor, making it hard for these fields to be concentrated to a high gradient, and cells naturally have very high gradient fields across the membrane. One exception to this is high frequency fields amplitude modulated at an ELF frequency. My thanks to Dr. Liboff for his concern and his time.

It's interesting to note that Brodeur also wrote "The Microwaving of
America", which was a scare book of the seventies claiming that
low level microwaves were causing a big problem.

Yes, that's the stuff. In fact the losses due to skin effect
resistance will be lower than for solid wire even if the skin depth is
not smaller than the wire radius., although the benefit might be
diminished in the extreme case. (operating frequency --> DC)

> I understand that this stuff was often used in low-loss inductors
> and the circularly-wound indoor antennas found on early BC-band radio
> receivers.

Well, it is still very popular in switching power supply design, where
high currents and high frequency (10s and 100s of kHz) exist together.
Litz wire is used in the windings of transformers and chokes where
long pieces of wire are needed to carry high current with low
resistive losses. Another technique commonly used is to wind a
winding with thin copper strap. This, like litz wire, has a high
surface area-to-volume ratio, and also has the benefit of a
self-inductance which is lower than litz wire.

> It seems to be hard to find mention of it these days,
> though, although the laws of physics haven't changed in 50 years and
> whatever advantages it had then should still apply. Perhaps the
> nuisance value of soldering all those little strands together was the
> problem; I don't know.

It's actually very easy to solder: one dips the end into a solder pot
which melts away the insulation and tins the wire simultaneously.

Absolutely correct, with the extra note that true Litz wire will have braided strands (as opposed to the simple twisting of normal stranded wire) so that each strand follows the same average path. I believe that this is an attempt to hold down the self-inductance that a simple helical path would give.

I don't have a source handy, although any of the major wire manufacturers probably make it. It IS still in use - look, for example, at the deflection yokes on various very-high-resolution monitors.

> usually two modulating signals. One is the useful signal which
>
Spread spectrum signals would not be received as a "continuously" sweeping carrier, as the original article mentions. There are two types of spread spectrum -- frequency hopping, ans pseudo-random noise. In frequency hopping, the carrier is "hopped" over many frequencies, not a continuous sweeping. In PN, the bandwidth of the signal is spread and requires special detection circuits -- not something that would be picked up be your everyday SW receiver.

My quess is the continuous sweeping is some sort of OTH backscatter radar.

Namibia's independence is being celebrated on the air at the moment.
Listen for V51NAM (Victory 51 NAMibia) and give them a call to help
celebrate. I've heard them on 10 and 20 ssb - in fact there were 2 or
3 stations on 20m at the same time with this call. I don't have the QSL
route, but they were asking that you get the op's name and put it on your
card so that they can figure out which station you worked. (Namibia used
to be ZS3, and was counted separately from ZS1 et al for DXCC purposes, so
the main change for DXers is the new prefix, if you are into such things).

I'm visiting Europe this Summer and am going to take my 2M HT with
me. I have sent away for reciprocal permits for France, Germany,
and Spain, and will also obtain permits in Italy and Austria.
I have already received the French permit. My next question concerns
operating procedures & rules.

Could anyone familiar with rules and/or customs in any of these
countries please send me some basic guidelines and/or differences
from the way things are done in KNW land? I'd hate to get my permit
pulled simply because I was an ugly American. :-) I speak bueno
turisto Spanisho, but can't speak a word of French, German or
Italian to save my life. I'm hoping I can use IPA to give my callsign
(e.g. Foxtrot slant November Six Quebec Quebec Quebec) and find some
English speaking repeaters out and about. I've checked and I can train
my rig to do 12.5kHz stepping, but I don't have any tone burst, and
I understand PLs aren't used over there.

Thanks in advance for any European operating advice.

This got mentioned a few months ago. This appears to be a dead issue; the FCC canned this idea. (At least according to traffic on the Net several months ago). This rumor surfaces every few months, but I think it can be safely ignored.

Source record: 12757

I have owned a Bearcat 100XLT for about four years. They are terrific scanners for general purpose monitoring. Mine has traveled with me on storm chases as well as doing daily duty as a police/fire monitor.

The battery life is very good. Mine generally gets 6 hours of continuous usage monitoring high volume channels. I am still using the original battery that was shipped with the unit.

I do have a problem with IM at my location. I don't really blame the scanner for all of it since I am extremely close (less than 1/2 mile straight line) to two of the transmitters. I can't really compare this radio to others since it's the first scanner I have had for any length of time.

Highly recommended.

In "Reference Data For Radio Engineers" (1977, Howard W. Sams), under the heading "Audio Filter Reactors (Coils) it states:

"Audio filter reactors.....are inductances that have the following qualities: (A) High quality factor (Q); and (B) Stable inductance with variations in frequency, operating level, and temperature.....(deleted discussion of distributed capacitance)....Rw (representing the copper losses in the winding) is made up of the dc resistance of the wire and the eddy-current losses generated in the winding. This eddy-current loss can be minimized athigh frequencies by dividing the wire into many small wires. This type of wire is called Litz wire." Notice that the term "high frequencies" is used in the AUDIO context, not the overall frequency spectrum.

This book is certainly not the "last word" on the subject, but since I don't see much widespread use of Litz wire in RF coils, my gues is that its advantage over solid wire is minimal (or at least not cost-effective).

There's no mention of the use of this wire anywhere else in the book.

>This is my first posting, so please forgive if inappropriate.

>Pier L. Bandini, Dept of Architecture, Penn State University.

I don't know anything about this specific proposal, but I am aware that
Southwestern Bell attempted the same thing two or three years ago.
The idea got shot down because it was argued that modem users were receiving
the same quality of service that everyone else was. Therefore, it was
not fair to single them out for additional charges. Appearantly they were
trying to find new sources of revenue to make up for the fact that they were
no longer being subsidised by A.T.&T.

I recommend getting a Firearm Owner's Identification Card. Here in Illinois it is a photo ID that is very easy to get. You pick up the form at any place that sells guns, get a Photomat picture of yourself and a check for $5 and send it in. They put the picture on the card with the info and laminate the works. Also good for writing checks and they ask for DL and a credit card. I just give them the FOIC instead of letting them write down my credit card numbers all over the place.

Richard: I have a TH-75, modified, but it doesn't transmit at 395 MHz. The mod I made was simply to remove the green wire inside the front of the unit. This merely expanded the receive bandwidth on both bands, as well as allowing xmit for the full 420-450 MHz.

Pray tell, good sir, what is the modification you performed? Also, what freq's did it open up to you? (Gosh! I'm just *full* of questions today!) Are you aware of a mod which allows cross-band repeater operation for the TH-75?

Thanks (as "they" say) in advance,

This is a great price for the PRO34. Read on:

I own a PRO34 and am quite happy with it. I believe it is every bit as
good as any other scanner in this price range including Bearcat.
There are two things that Bearcat has done better than the PRO34. One is that
it scans at twice the speed and two, it has a better audio output.

The things I like about the PRO34 that the Bearcat doesn't have:

You don't have to use a battery pack like in the Bearcat. You can use
nicads or regular batteries, which means when you need batteries, you can
shop around for cheap nicads or cheap alkaline types instead of having to
pay Bearcat for an expense battery pack. The nicades I am presently using in
my PRO cost me about six dollars total.

I believe there is more information presented on the PRO LCD readout than in the
Bearcat.

And I don't believe the Bearcat has two buttons on top for scan and manual like
the PRO does. This is real handy for one hand operation and you don't have
to fumble for the keys or look at what you are doing to go back and forth from
manual to scan.

And finally, I believe the search features on the PRO are superior to the Bearcat. You can do an automatic scan up or down from a programmed frequency. Does the Bearcat have 10 auxillary memories for storing search frequencies like the PRO does?

All in all, they are both great scanners for the money.
Of course I bought my PRO on sale for $229 dollars. And when I don't pay what I think is too high a price for something I simply enjoy it more.

I don't know much about the material itself, but you can still find it on
many transistor radio loop antennas (at least, several transistor radios I've
torn apart recently have them).

> Anyway, if you have a current source for the stuff, I'd appreciate
> hearing from you!

Once source is Amidon Associates, 12033 Otsego St., N. Hollywood CA 91607, who
wanted $0.05/ft for 8/42, 8/44 and 10/44 Litz wire as of July '89 (the most
recent price list I have).

From: sawyer@twg.com
Message-ID: <271@gollum.twg.com>
Source record: 12751

In the latest issue of the "DX Bulletin", which just arrived in my mailbox today (March 22), there is a copy of a letter given to Jim Smith by the PTT in Bhutan. To get right to the heart of the matter, they told him to bring $50,000 for a fee when he came to pick up his A51JS license. As I'm sure many of you know, A51JS is on the air now. This is the first time that A5 has been active since the early 80's. That's great news, but the issue of the $50,000 is not. Since Jim is making an appeal for help in footing the bill, I can only presume he caved in to this outrageous demand.

So now comes the question. Presuming for the moment that you will agree with me that we do not want to encourage third world countries to extort the international amateur community into paying ransom for licenses, we are left with the choice of whether we respond to Jim's request for assistance here. If we do send in contributions, then we have helped Jim to simply pass it along and the next guy looking for a day in the sun will know that cost is not an issue. For that reason, I think a point needs to be made with THIS one that the amateur community simply will not be pressured into paying big bribes. Contributions to DXpeditions which help to defray travel and equipment costs help keep the DX community going. There are plenty of opportunities (e.g. YASME) where we can offer this kind of direct support. That isn't what's going on with A51JS, though.

1801. Second Annual Open House at WPI / W1YK

Newsgroup: rec.ham-radio
Date: 1990-03-23 01:25:45 UTC
From: jwhitson@WPI.WPI.EDU
Message-ID: <9003230125.AA23397@wpi.wpi.edu>
Source record: 12759

On April 7, 1990, at Worcester Polytechnic Institute
in Worcester, Massachusetts, the WPI Wireless Association
will be holding The Second Annual Open House in its Ham Shack.
It will run from 10:00 AM to 4:00 PM. We will be working
on many bands (160m - 10m, 2m, 440MHz, as propagation permits),
and in many modes. The Club Station, W1YK, is excellently
situated on the roof of Salisbury Laboratories, which is one
of the buildings on the top of a large hill where WPI is located.

The WPI Wireless Association, founded in 1909, is the oldest college
radio club in the United States. Originally 1YK, the station and
club has enjoyed a wide variety of equipment and opportunites, including
a 440 MHz repeater and a satellite tranciever station.

Come and help us celebrate our 81st Anniversary!

For more information, send mail to me (see signature), or any of the
people you hear working as W1YK.

---------- If at first you don't succeed, so much for skydiving ---------
John Whitson: Internet: jwhitson@wpi.wpi.edu Bitnet: jwhitson@wpi.bitnet
73's from KB2GNC/1 UUCP: uunet!wpi.wpi.edu!jwhitson
---------- Anything with this tag on it is purely my own opinion ---------

Directions to WPI follow:

From East or West:
Get on to I-90, the Massachusetts Turnpike. Travel until you
get to the intersection of I-290 and I-395. This is about
50 minutes West of Boston and 50 minutes East of Springfield,
and also one exit East of the I-84 intersection at Sturbridge.
Exit and follow the signs for I-290 East to Worcester, Auburn, and
Marlborough. This is done by staying completely to the left after the
toll plaza.

From the South:
(Connecticut). Get onto I-395 and proceed North. At Auburn and
the intersection of I-395 and I-90, the highway you are on will
change to be I-290.

From the South, East, West:
Proceed East on I-290 until Exit 17. This is Rte 9, also
known as Belmont Street. Exit I-290 and at the light, make a left.
Stay in the middle-or-right lane, and proceed straight through the
next two lights. You will see the Courthouse on the left and the
Worcester Memorial Auditorium on the right. Proceed up the Hill.

From North:
Get onto I-495 going West or South. Proceed until Exit 24,
the intersection with I-290. Get onto I-290 and continue
West until Exit 18, which is Rte 9, also known as Belmont
Street. This exit is right after two large merges, so you
will have to cross 4 lanes of traffic quickly. Exit, and
at the light make a right. Follow the road until you intersect
with Rte 9, also known as Belmont Street or Highland Street.
This is a *big* intersection. Make a Right onto Highland Street
and proceed up the hill between the Courthouse and the Auditorium.

From in Worcester:
At the top of the hill is a pair of lights. Proceed through both.
about 1/2 mile down the road there is another light, with a Store-24
on the corner. This is West St. Make a right here and proceed.
The stopsign marks the edge of WPI. Proceed straight accross, and
park in the parking lot to the left at the top of the hill. At the
very top of the hill, on the right, on West Street, is Salisbury
Laboratories (you can see the antenna arrays for miles). Follow the
signs.

Now that I have received my PRO34 and had chance to use it, let me say the $175 was a great price this piece of equipment. I have done the 800mhz mod to restore full 800mhz coverage. The audio is not a real problem for me as I play it through a home made speaker/descrambler (so I can monitor the local police) that has a built in amp. Your are right that the scan speed needs a bit of help and im hoping soneone out there may know of such a mod. (If so please E-Mail it to me)

Bottom line, im feeling a-ok now that the PRO34 is here!

I assert there is no concensus on this issue. If your belief is different
than mine (and I am sure it is) then I am correct in my assertion.

> law, but also) because it removes the usefulness of the CW requirement.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
We also certain disagree here. More on this below.

> If you really learned CW, you could use in on the air. By using this
> method, you will be incapable of using CW. This situation is analagous
^^^^^^^^^^^^^^^^^^^^
What is the purpose of a CW test? To cause people to be capable of using
CW? If so, it is not working because I, and a very large number of hams
are presently incapable of learning CW, and we did not even need a clever
method of doing it. I am sure the vast majority of Technician class hams
cannot operate CW now, and large numbers of even extras cannot.

> to somebody who memorizes the answers to the technical/legal questions,
> without even knowing what the questions were. Such a person can pass
> the test, but all of the useful technical/legal information is not
> available to them to draw on because they didn't learn it! I don't
> think any of you no code folks would approve of somebody using this kind
> of method to subvert the useful technical/legal written test(s);
> likewise you shouldn't approve of this method to subvert the useful CW
> requirement.

If we agreed that the CW test was useful, we would not approve of this method.
Many people feel that the CW test serves no useful purpose. It does not
succeed in any stated purposes, including the one you seem to be stating,
that it is to get people to be able to operate CW.

I personally agree that this method will not result in learning CW properly to be able to operate it. But if it helps get a new ham into the hobby and service that would otherwise have not been able to, and if this guy is one who will be contributing, such as in areas of packet radio, them I am all for this method or any other that gets the job (of passing the test) done.

To all those who have no interest in CW, the first thought on their mind is "why do I have to take this stupid test". After they realize the test is not going away the second thought they have on their mind is "how am I going to pass this test". Note that they do NOT think "how am I going to learn CW". A few people just go off in disgust thinking "those stupid hams, all they want is to pound brass, work DX countries, collect QSL cards and certificate, and they think that is all there is" when what they were interested in was experimenting with the technical sides of radio, and these are the people who could be the INNOVATION back into ham radio that are being scared off by useless code requirements.

Since it is the case that LEARNING CW serves no useful purpose to those who have no interest in operating CW, the only logical approach they would have to the "CW test problem" is how to PASS it, get around it, or whatever.

You, sir, seem to be objecting to the fact that people do not have your attitude about CW that it is something worth learning and using. You will just have to accept it as a fact of life that lots of people have NO INTEREST WHATSOEVER IN OPERATING CW for whatever reason (and there are various reasons). If you cannot accept that, then I would have to think of you as one of those people who wants everyone to be all alike, and just like you, of course.

The present theory exams are already not serving their intended purpose. I have spoken with many hams who have an extra class exam and could not design a radio with the ARRL handbook in front of them. Of course, today, not everyone needs to design radios, but not everyone needs to know CW, either.

One needs to know CW in order to operate CW. When the CW test was first being given, all radio operation was CW, so there was a one-to-one relationship between learning to operate CW and learning anything else about radio. Remember, the test back then was a SENDING test. It was not designed to keep out the riff-raff, but rather to keep out anyone who just didn't yet know the code (or the CORRECT code, as the case probably was at the time) As soon as phone came along, the test should have been abandoned at that time, or else used to grant privileges to operate CW. Since few hams operated only phone at that time anyway, there was not that much pressure to delete it.

Don't count on the modem "tax" idea dying (sp?) out. The fact that the TELCOs can fit more than one voice conversation onto a 64 Kbs channel, but can only fit one modem session per channel means that effectively they are "losing" money on modem use. Combine this with the explosive growth in the use of FAXs (modems) and I think you will see the TELCOs developing innovative types of signal recognition to differentiate between high density and low density use of baseband channels.

N2HHR (mark hilliard) inquires:

>Is the MFJ product line as bad as he claims?

I just bought an MFJ "econo keyer", a small electronic keyer that sells for just under $50. Has a Curtis chip in it, and the circuitry is identical to the keyer that sits on top of the Bencher iambic paddle. (Incidentally, the keyer that goes on top of the Bencher costs more, and in my taste, is uglier, so I didn't buy it, although I use Bencher.)

This keyer suffers from RF feedback. When I run my rig (an IC-720) at more than 50 watts, "0" becomes "2" (that is, _____ becomes ..___) - a most ingeneous feature, nicely complementing my poor sending skills! I plan to fix it today, by sanding off the paint inside the box, and giving it the same ground potential as the transceiver.

As for other products, I don't have first-hand experience.

I have heard more than one person comment on his experiences with My Friend's Junk. My problems are fixable, so that's okay. If you're looking for a product that will work flawlessly from the moment you buy it, MFJ may not be the right choice. But I don't know for sure. Some people are quite satisfied with what they got. For example, I have heard conflicting reports on the MFJ-1278 multimode TNC. A friend likes it, another person hates it - I'll never buy it. Somebody had an antenna tuner that worked - I'd either build my own, or buy another manufacturer's (like the AEA 300 watt tuner).

Take this BOZOs comments with a grain of salt... This "Gentleman" keeps
IRCs and Cash sent to him when people try to QSL with him. I caught him
on several contests and he has told me twice that he would QSL if I sent him
a card. I did better than this... I sent him my QSL card, 3 IRCs and a
Self address envelope. I have never recieved a card back (this is over 1 year).

I recieved a card from V31DX two days ago after only one month... And this Ham
said he was sorry for taking so long... One month is pretty good!!!!

Now as for the comments about MFJ gear... I have owned a MFJ-1274 for 3 years
and it has never failed me... It has been left on for 24 hours a day for about
the last year.... What a great TNC!

As with any company I am sure that some products are not fantastic...
But I have been very happy with what they sell...

Phil Howard's reply to a proposed method for learning CW included the statement: "...I, and a very large number of hams are presently incapable of learning CW...."

What on earth is this?? I see a KA9WGN on Phil's signature, so he has either learned CW (thereby completely disproving his point), or he somehow obtained his call without passing the code test. NO! There are no hams who have obtained their tickets under existing rules who are INCAPABLE of learning the code.

There are some good arguments for no-code, but the human mind's incapability to learn is not one of them, as any study of the psychology of learning will show. CW is nothing other than a set of symbols, much as writing, or the spoken word. If one is capable of learning a language, or to read, then one certainly CAPABLE of learning CW. I submit also, that if one can learn to type, one can learn CW. I hate to see the concept of learning MOTIVATION confused with learning ABILITY.

But onward to another point: Let's say that the CW requirement had been dropped in 1929. I submit that there would have been in the intervening years a number of attempts to reduce or eliminate the technical requirements for a license. I submit that MOST of the arguments that have been presented in opposition to the CW requirement could JUST AS EASILY be applied to any other entrance requirement, including examinations. Just plug in your favorite hang-up in place of "CW" in all the preceding arguments and see how it comes out.

Thanks,
Dube Todd, N5PDK

We all know about the Cellular Phone Industry. We all know about the insidious ECPA. This article is related to these topics, but not exactly.

Cellular is NOT the only mobile phone technology, as I am sure you are aware. In many communities, the older 152 mhz band phones still operate. In addition to this band, there is an 800 MHZ cellular smell-alike system called SMR (smurr) which uses EXACTLY the same trunking technology, but on a slightly different band. My community recently (last month) became the recipient of this technology. While scanning the 800 mhz region on my UNMODIFIED PRO-2005, I found several frequencies with a new strange BUZZING digital signal. Within a few days, I started hearing test conversations on other frequencies in the range. I knew it was technicians, and I assumed it was SOME kind of new service, possibly business related. Imagine my surprise when I began to hear telephone conversations, with very clean crisp audio (Much better than the 152 mhz system, which over the years has gotten muddy and distorted)...

Then newspaper and radio ads began appearing for a WONDERFUL NEW telephone system. The name of this wonderful new system is something like "PRIVACY PLUS" a name that makes it sound even more wonderful than cellular.

Soon more and more activity was noted, and our local scanner SIG began discussing the new phone system, made by MOTOROLA. The technology is exactly the same as CELLULAR, just a different band plan. A band plan that is NOT eliminated from ANY scanner on the market. No diodes to clip, the signals are there for the monitoring.

Now it is my understanding that the ECPA forbids monitoring of all such mobile phone calls, except for determining the source of interference. Thus I guess by regularly scanning an authorized portion of spectrum, and being totally unaware of the existance of this service, we became unwilling radio criminals.

Well I decided I wanted to know more about the system, so I called the company selling it. I asked for information, the more technical the better. I received a coverage map and a price list in the mail. Then I received a sales call, where someone offered to bring a unit to my home and demonstrate it. I declined the offer, but said I was interested in the system, and wanted to know more about it. The salesperson knew very little about the technology except to say that it was the same thing as cellular, only "on our own frequencies". I then asked my key question:

"What about privacy? You call your system "Privacy Plus", does this mean it is secure, maybe even better than cellular?

"Oh YES, our system is very secure!"

"But what about shortwave listeners or ham operators, don't they have police scanners or something that would allow them to listen to my conversations?"

"No, this is not possible, you see our tower sends out a signal every ten seconds, and that makes it impossible for anyone to evesdrop on your communication. PRIVACY PLUS is just what the name implies"

I wanted to SHOUT at her that at that very moment, my unmodified scanner was picking up one of the salesmen doing a demo for some other unsuspecting customer. Instead, I just asked to be kept on their mailing list. She said she would call me again in June...

I believe that the sales people are NOT to blame here. They just want to sell the equipment, and they either make assumptions, or their bosses have convinced them that the name PRIVACY PLUS is more than just a silly meaningless trademark.

The same sales tactics are used to market CORDLESS PHONES, that have a PRIVACY button which does nothing but change frequency. Yet everyone I know who has a cordless phone thinks that it is a PHONE.

For those who MONITOR the 46.61-46.97 band, I do not have to tell you that people who use these things have no idea how far their signal travels. I live in a small town, and with a good outside antenna, that band is CONSTANTLY filled with activity, and some of the most AMAZING conversations one could ever hear.

I hear two different interpretations of the ECPA regarding the 46/49 mhz band, and perhaps someone out with more knowledge can set the record straight. In a recent POPCOM, Tom Kneitel said it is illegal to monitor the "Pedestal" (or base unit) portion of the signal, but the 49 mhz part was OK to listen to. I think this is nit picking. Cordless phones have NO license, and they have a nearly hidden notice stating they may not be totally private. I also understand that court cases have upheld the fact that these units have no guarantee of privacy, and people get busted for making drug deals on their cordless phones.

Has anyone read Kneitel's book on Telephone Monitoring?

And is there anything we can do to get these sales people to stop lying to their customers about PRIVACY PLUS and the PRIVACY BUTTON and other deceptive mind balm?

Howdy:

I (FINALLY) got my copy of QEX today (not their fault, I waited until the last possible second to renew just like always) and read McClarnon's (VE3JF) article, "More Ideas for a Robust HF Packet Signal Design". I have just a couple of comments:

HIP HIP HURRAY. HIP HIP HURRAY. Sanity at last. Barry just moved to the top of the list to test DSP modems built by yours truly for HF.

If you want to read a couple of sane articles about HF, I suggest you get a copy of the March 1990, QEX and his earlier article in QEX in December 1987. A relevant article is done by Allan Kaplan, W1AEL, and is a nice thought provoking piece, even though I came to the same conclusions Barry did. You may find Kaplan's article in the November 1989 issue of QEX. It appears that QEX is providing a useful forum for discussion of HF modems/protocols. I will describe my work there in order to fulfill a (two year old) promise to Rinaldo. What Barry describes as his `ideal modem', one which does multiple bits/baud and the baud rate is 75 baud, is exactly what I have done and the first report was given at DATASPACE 1989, last July in Guildford, University of Surrey, England. There were few details and now that I have actual `tnc hardware/software' to hook it to, the testing should proceed at an accelerated pace.

At the moment, I am really busy adding satellite modems, and other `required' modems (Why do I need to add THIRTY different tone pairs for a single HF FSK modem?). I'm also hacking a modified duobinary partial response at 4800 baud (a sane approach to going faster with existing FM radios, No DC and no excess bandwidth), and other goodies (all the usual HF WEFAX, AMTOR etc.)

I hope to see many of you hams at Dayton and to show you all of the wonderful toys during either my packet or satellite talk.

Once again, I recommend Barry's work/papers highly.

1819. The BEST scanner antenna!

Newsgroup: rec.ham-radio
Date: 1990-03-23 19:59:41 UTC
From: flash@lopez.UUCP
Message-ID: <1222@lopez.UUCP>
Source record: 12764
Cross-posted to: rec.ham-radio,rec.radio.shortwave

This is posted to rec.ham-radio AND rec.radio.shortwave. SAY YES to rec.radio.scanners, eh?

A year or so ago, I decided I wanted a GREAT scanner antenna. Wide coverage, and the ability to pick up weak signals, since I live in the boonies...

Everyone suggested I get a discone... And after the prices were examined, I thought that $100 or so was a lot to pay for a twinky little antenna with unity gain. Thus I decided to build one. Thanks to USENET I collected all sorts of plans, diagrams, etc. Being lazy, it soon became winter and my plans were put on hibernation.

Now spring begins to rear its head, and my thoughts again began to turn to better signals.

In the meantime, I had done a lot of reading about scanner antennas, and found out that one of the equipment reviewers in one of the magazines uses the MOTOROLA MONITENNA Model #5094 as his STANDARD by which to judge all others. No other antenna has yet beaten it, said the reviewer.

Then I got my BOB GROVE catalogue, and in it, Bob says: "The best Outdoor Scanner Antenna made is the MOTOROLA MONITENNA MODEL #5094" However GROVE does not sell it. They said it is just too big for storage and shipping, but if a person wanted the BEST, they should get THIS one, from a Scanner Dealer or TV shop.

That convinced me that it must be good, and I am forever thankful to Bob Grove Enterprises, even though the only thing I have ever gotten from them is Monitoring Times (One of the best if not THE best SWL/Scanner/monitor magazines of all time)...

Finding a dealer to sell me the antenna was a bit of a challenge, but finally a local CB dealer said he would order it. He got three of them in, and they sure come in a BIG box, which is very OXY to try and get home in a compact car, let me tell you.

There were just one pleasant surprise after another with the antenna though. The first good news was the price. My dealer only wanted $40 for it. I figured there must be a mistake, but that was HIS price (The guy is not out to get rich, and runs his shop more as a hobby). The next surprise was that the antenna requires NO assembly. It opens up like an umbrella. Everything snaps into place. BINGO. The antenna comes with 65 feet of coax already attached, AND a motorola plug soldered in place. (I had to get a convertor to use it with my

PRO-2005)...

But the best news of all is that it WORKS. This antenna has GAIN on the most popular scanner bands, and I began to pick up things I had NEVER heard before even with other outdoor antennas.

This antenna does not claim to have the wide flat coverage of a discone, but I am able to hear things very well outside of the bands that it says it covers. EVEN the FM broadcast band was hopping with new stations. The MILITARY air band works great, and I am also able to hear Canadian Commercial aircraft. ALSO I finally heard a transmission on 123.45, the pilot to pilot chat channel. Since we have only one commercial flight a day out of our podunk airport, this one had to be way off in the wild blue... I can now hear a mobile phone tower 60 miles away, and the coast guard from over 100 miles away on channel marine channel 22.

Cordless Phones? HA! They are stacked three and four deep and that band is NEVER quiet.

Would I recommend this antenna? YOU BET YOUR PLL I do... The other two that the store ordered went like hotcakes, and he ordered three more.

There is one of those three left, and it is MINE. My second MOTOROLA MONITENNA Model # 5094 goes up 40 feet SUNDAY....

Talk to your local CB or SCANNER store. Get your local monitoring group in on the deal. Have your CORDLESS PHONE MONITOR SIG order them bulk!

This is one fine antenna....

(I do not work for Motorola, or any other electronics wholesale or retail firm, I am a computer consultant, and the radio hobby is what I do to stay sane)

I didn't say anything the first time this subject cropped up a few
weeks ago because my experience with MFJ products is limited. But I've
been using the same MFJ 901 tuner for six years now to tune my aluminum
porch awning, and it's been fine. (When I had the carport hooked up, I
had another 901 on it.)

True, I only run 100 watts into them. But anything that can bring an
awning's SWR down to 1:1 on everything from 10 to 80m is okey-dokey
in my book.

MFJ, like so many other little companies that today are the source of
so much amateur stuff, has its share of problems. But it is generally
acceptable stuff. I have half a dozen MFJ 1270s and 1274s, and one 1278
and they have generally worked flawlessly for several years. Our club has
several MFJ antenna tuners; these are fine.
The crank on 10? He's a bozo. A lid. Ignore him, turn
off the two-way and turn on the broadcast band rig. But mainly ignore
him. But so long as rif raft 'round him, he's got a captive audience.

>>today (March 22), there is a copy of a letter given to Jim Smith by the
>>PTT in Bhutan. To get right to the heart of the matter, they told him to
>>bring $50,000 for a fee when he came to pick up his A51JS license. As I'm
>>sure many of you know, A51JS is on the air now. This is the first time that A5
>>has been active since the early 80's. That's great news, but the issue of the
>>$50,000 is not. Since Jim is making an appeal for help in footing the bill, I
>>can only presume he caved in to this outrageous demand.

[rest deleted]

Both QRZ-DX and The DX Bulletin say the fee is $5,000 and not 50,000.
This is apparently based on the "standard tourist" rate of $200 per day
for a 25-day stay. If Jim Smith were touring around, looking at whatever
it is that Bhutan has to offer, I suppose it might cost him that much, but
since all he's doing is sitting in one place playing with the radio, I guess
they decided they should relieve him of this much money for the privilege
of doing so.

If things go well, this will work out at a few cents per QSO, and can
probably be covered by contributions he receives with the cards people
send him. You can argue that even $5000 (or $500 or $5) is too much to
pay for the privilege of operating from Bhutan, but it's not quite as bad
as 50K.

Message-ID: <19801@ea.ecn.purdue.edu>
Source record: 12628

>>From: mark@gizzmo.UUCP (mark hilliard)
>Every day without fail there is a fellow on (ve31bb or v31bb)
>who has the loudest signal that I have EVER heard (he must be pumping 1kw)
>talking or trying to get people to talk about poor MFJ product quality and
>design. He is claiming all kinds of problems from MFJ on products and support.
>The number of people joining in is astounding! Is this possible? Is the
>MFJ product line as bad as he claims? If so, why is the league promoting
I have heard him and listened with upraised eyebrow on many, many
occasions. First off, I have heard him say that anyone who runs
under 250 watts is an "insect" whodeserves to be squashed by
the 1KW flyswatter. Me and my barefoot Uniden HR2510 (which has
worked from Indiana to Japan, Cuba, Mexico, etc.etc. take
exception to his "pro" ham attitude.

>I dont agree with his method of attracting attention to his cause on 10 meters.
Nor, it seems, does the Belize equivalent of the FCC. I heard him
whining one day that somebody at MFJ had gotten these folks on
him, who promptly told him to "cool it". He launched into a
diatribe about how Belize must have been worried about having
its foreign aid cut off and so on or maybe MFJ just bought
them off, so on and so on. He acted that day more like a
whipped puppy than his usual obnoxious self.

>Any comments on MFJ or this fellows means of getting support?
Yes. I think he acts like a real jerk. Sure, I'd love to have
a QSL card from Belize, but since his royal behindness deigns
to not lower himself to QSO with "insects", I can get nice QSL's
elsewhere, thank you.

I don't know about MFJ quality, not ever having owned any.
However, I *do* think that discussing the quality of ham
equipment on the ham bands is acceptable. I *don't* think
that V31BB'S diatribes against MFJ are acceptable. This goes
far beyond a simple discussion of quality and sounds more
like a personal vendetta. If I was running MFJ and had
to put up with this, I'd try to find a way to sue him
and force him to either "put up" evidence to back up
his slander or "shut up". (you know, "put up or shut up"?)

It is people like V31BB that give Amateur Radio a bad rap.

I agree, but since the $50,000 figure is pretty unbelievable, one might conclude that accepting this story as reported is "indicative of poor judgement as a ham". :-) Seriously though, knowing Jim Smith, I would be very surpised if this story is accurate.

> ...Is MFJ product line as bad as he claims?

To be charitable, many MFJ ham products seemed to be kind of junky,
but they did fill a need for low cost ham accessories that Heath
and other companies stubbornly refused to fill.

I had to fix at least one bad solder joint in 3 of the 4 MFJ
products I own. Some of the hand wiring was deplorable, including
insulation melted on the wires. IMHO, MFJ low power antenna tuners
looked kind of raunchy, too.

I generally like their electronic keyers. The MFJ products which use
PC boards appear better quality than their antenna switches and tuners.

Our local police use what is commonly called "PHASE INVERSION" and sounds like someone w/marbles in their mouth. Being the bottom of the ladder in 'secure' communications it can actually be recorded scrambled and later descrambled when played back. Anyway - ill have to look and see if the design is still laying around here. If I can find it in my piles of papers ill post it.

In his posting about the current DXpedition to Bhutan, AA6KX claims that the Bhutan government is "extorting" $50,000.00 from VK9NS to get a license to operate there, and that his allegation is supported by the current issue of The DX Bulletin.

Both the current issue of The DX Bulletin and QRZ DX say that he was told to "bring $5,000" to enter the country, NOT "pay $50,000 for a license."

Please get your facts straight before broadcasting something like this to the world. Not only does the DX Bulletin plainly say 5,000, not 50,000, but neither publication says anything about "extortion" or this even being a fee to get a ham license!

> >Since it is the case that LEARNING CW serves no useful purpose to those who
> >have no interest in operating CW . . .
> >
> >--Phil Howard, KA9WGN--
> ><phil@ux1.cso.uiuc.edu>

BTW, the context of these quotes are a generalization of the people I
know who have expressed interest in ham radio and a disinterest in code.
It does NOT include those who express an interest in code.

> You sound just like many freshman engineering students complaining about
> having to learn calculus, or take freshman English. You don't yet have
> the broad educational background or the experience to understand what is
> good for you, and so you complain about things you don't understand and
> don't like. Fortunately, most freshman engineering students figure out
> by their senior year that calculus is useful, and hopefully when they
> get out on the job in the real world and have to write [gasp!], they
> figure out that even freshman english might have been useful.

I happen to know that calculus and freshman English are not only useful
but very critical. In fact, I would push for sophomore and junior level
technical writing classes, and mandatory 2 years of linear algebra for
engineering majors. Far too many engineering graduates cannot write a
technical paper or even a decent resume. Far too many engineering
graduates don't know applicable fields of math beyond calculus and
differential equations. But I guess you probably agree with this anyway.

However, you have made one SERIOUS ERROR: you assume that code is good
for everyone who is a ham. This is ABSOLUTELY FALSE!

Knowing code is good for anyone who wants to operate code.

> Note: this is not a personal flame; if you also hold these attitudes
> about CW please consider yourself flamed also.

And of course my flames are not personal either, but are to be spread to
all those people who think everyone needs to learn an obsolete communcations
mode they are not interested in (but I'm not against people learning it for

whatever reasons they choose to).

I guess this whole issue is boiling down to:
PRO CODE vs PRO CHOICE

PRO CODE people want to force their opinions and belief systems on others.
PRO CHOICE people want to let individuals choose for themselves whether or not they will operate CW modes, and those who want to can learn it.

> I do not want to start a war. Unfortunately, I'm sure I just
> did. Please, only reply if you have rational logical comments (pro or
> con). Don't flame me or this newsgroup with no-content messages.

There is plenty of content here. Basically it is telling you about areas you misunderstand, like the fact that NO ANALOGY exists between something we agree about (freshman English and calculus are good for engineering students) and something that we do not agree about (knowing Morse Code is good for hams who don't want to use it).

How about reducing the subject to just the part that we disagree about: whether or not Morse Code is good for people who don't want to use it.

> >What is the purpose of a CW test? To cause people to be capable of using
> >CW? If so, it is not working because I, and a very large number of hams
> >are presently incapable of learning CW
>
> The CW requirement/test DID serve the purpose of causing many hams
> (including myself) to really learn the code and thus have a useful
> skill. If only you would drop your defeatist attitude, you too could
> learn CW in short order. I put forth that the only reason people

I know I can learn CW, and actually I plan to after, and ONLY AFTER, the no code issue is overwith. I will remain a Tech until then.

> "can't" learn the code is self-imposed impediments. What this country
> needs is a few more ambitious people determined to conquer the
> (perceived) obstacles and be _WINNERS_!

Very few people can't learn code. But we are not talking about these people. The vast majority of people can learn code and I will say that just as you would. We don't disagree with that, so your arguments are wasting time. Let's argue about what we disagree on.

You got ONE thing right back at the beginning of your posting where you referred to people who "REFUSE" to learn code, as opposed to people who "CAN'T" learn code.

I passed the 5 WPM exam by memorizing the code table well enough to mentally look it up fast enough to get enough of the test transmission to be able to squeak through the test. My copy was only 30% but I managed to get enough of the right stuff to get 9 out of 10 questions right.

Now, did I "learn" code? Definitely not.

Do I plan to "learn" code sometime in the future? Well, I must admit that I plan to, but only because I happen to think that CW might really be a fun mode to operate. I was bored stiff with it at 5 WPM but I think it might be more fun at 30 WPM. Someday I will give that a try.

But not everyone shares my feelings nor yours.

But for all those people who do not share my curiosity and interest in code, I would not wish upon them the waste of time they have to go through to EITHER learn something they won't use, or memorize something they won't be able to use that way.

1834. FCC FY 1991 Budget Request

Newsgroup: rec.ham-radio
Date: 1990-03-24 16:36:23 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9003241636.AA13728@cmr.ncsl.nist.gov>
Source record: 12637

Extracted from "Broadcasting", Mar 19, 1990

Work toward a standard for the broadcast of high-definition television will get a big boost - if the FCC gets all that it asks for in its proposed $118 million budget for fiscal 1991.
....
According to a breakout of the budget request, the FCC has allocated $300,000 for outside studies on HDTV and $50,000 for new lab equipment for HDTV work by the (FCC) Office of Engineering and Technology (OET).
The balance of the additional (HDTV) funds would go toward the hiring of six full-time employees devoted to HDTV - one attorney and two engineers in the Mass Media Bureau and three engineers in OET.
....
The FCC's proposed budget for 1991 is $10.5 million more than it has to work with during the current fiscal year.
....

* Further confirming Sikes's reputation as an enforcement-minded chairman, *
* 13 [new employees] would be involved in enforcement in one office or *
* another: ..... , an attorney to effect its amateur radio compliance *
* program, an attorney for rule-makings in land mobile and private radio, *
* and two technicians and three engineers for the Field Operations *
* Bureau (FOB).

The FOB's facilities would also give a facelift. Some $326,000 is slated for new equipment for the Bureau, $110,000 for new vehicles, and $100,000 for miscellaneous repairs to various field facilities.
Sikes told the congressmen that he would like the FOB to take a more active role in enforcing FCC rules. Right now, he said, the FOB, because of its limited resources, acts only after it receives a complaint.
....
Even though the request represents a 9.7% increase over fiscal 1990, Sikes made it clear that it falls short of what the agency needs to keep up with the dynamic telecommunications industry. Revenues from the "communications and information" sector doubled in the 1980's, he said. "At the same time, however, the FCC's budget actually shrunk by nearly one-third in terms of actual spending power," he said. "The FCC will...embark upon this last decade of the 20th Century with 20% less in revenue and human resources than it enjoyed in 1981."
....

>Some people are quite satisfied with what they got. For example, I
>have heard conflicting reports on the MFJ-1278 multimode TNC. A
>friend likes it, another person hates it - I'll never buy it.

Being the friend who likes it, I'll stand by the claim. The 1278 does
generate some RFI -- unless you ground it, as per the directions. Aside
from that, it's heads above the rest...as long as you have the current ROM
and board revision (according to QST, the previous rev was pretty bad).
I wasn't too impressed by the software for the mac, especially since the
version for the PC is so much better. But, having other facilites, this
doesn't bother me. What would bother me would be to have hf packet
performance that's as bad as the other MMDCs, or not having grayscale on
my FAX.

Most digital devices require at least some modification for the shack
environment, even those destined for the ham market.

1836. IC-2SAT TX/RX mod

Newsgroup: rec.ham-radio
Date: 1990-03-24 20:00:22 UTC
From: mgb@TECNET1.JCTE.JCS.MIL
Message-ID: <9003242000.AA07879@tecnet1.jcte.jcs.mil>
Source record: 12638

I read a posting a few weeks ago where a gentleman was interested in any mods for the IC-2SAT that extended transmit or receive frequency range. I didn't pay much attention to it then, but when the XYL got one for me as a birthday present... that attitude changed markedly! :-)

Well, I gathered up all I could find on the issue and broke out the soldering iron and took apart the radio that was less that one day old. (OH NO Mr. Bill!!!!)

Here's the straight scoop and I HAVE tried this but you still proceed at your own risk (in case you were so foolish as to not know that :-)

Take the battery cover off the bottom and remove the two screws.
Remove two screws directly behind PTT button.
Remove one screw where handy-carry strap goes.

Gently pull on the front half of the radio and the radio will split apart but don't pull TOO far because the front half of the radio is still attached to the back half with that flexible plastic film wiring stuff. Fold front half to the right and lay it down.

WARNING: The battery//cover release button can now pop out and a little itsy-bitsy tiny spring can take off for parts unknown. (Ask me how I know this... I spent 2 HOURS looking for that little sucker!) Pull the button out of the case NOW and watch out for that blasted little spring!

All work is done on the circuit board inside the FRONT half of the radio (the part that you just pulled off).

EXTENDED RECEIVE:

Look along the RIGHT side of the circuit board and about halfway down the right side you will see a tiny circuit board that is mounted VERTICALLY on it, aligned from top to bottom. Look at the TOP of this little tiny board and you will see a normal diode (D-9) that is vertically mounted on the vertical board. Sounds confusing, but you can't miss it, it's right on the top end of the board.

Cut this diode. Don't try to unsolder it... CUT IT. Take my word on it.

WARNING: Don't pull the diode away from the board and leave it hanging. When you put the radio back together it is a very close fit and if you short the diode, the radio won't work. The PLL stays unlocked but no damage will occur. (yeah, I did that too :-)

If you stop right here and reassemble the radio, you will now have extended RECEIVE capability after you reset the radio according to the instructions in the manual on the first page. And it REALLY is extended. My PLL was

still locked up down around 88 Mhz and actually received FM broadcast stations although it obviously sounded BAD! :-) The radio freq. read-out now will go all the way up past 1 GHz, but that's just the dial read-out, check the Channel Indicator and when it goes to a "U" for "Unlocked" you can keep an eye on PLL performance, however I was amazed at where the PLL was locking up and the fact that it was actually receiving (albeit poorly) across a very very wide range. Yes, of course the sensitivity is way down the further you wander from the 144-148 design frequency range but it still is pretty impressive, and the new freqs. can be stored in memory and scanned.

EXTENDED TRANSMIT:

Look for the big IC directly in the middle of the main board on the front cover (IC-1 40608). Go to the bottom right corner of it. Move your eyes slightly to the right and you will see three chip resisters in a row. Just to the right of THOSE you will see three silk screened dots that are bracketed by a rectangle of white ink lines where a factory diode package would have gone. The "dots" form a triangle with one at the top and two at the bottom. Install a diode (1N914 or equivalent) with the cathode on the TOP dot and the anode on the bottom left dot.

This will give you extended transmit from about 138-163 or so.

But if you believe that trying to get a diode in there (without shorting out a lot of stuff) is impossible, (and you are very close to being correct) then FORGET this approach. Instead get Icom's diode DA (# 1750000160) and install IT in the same place.

I tried using the 1N914, and it was a TOUGH job. It worked but looked horrible and was in imminent danger of falling off. I tried it out, verified that it worked... and pulled it right out. I have the diode DA pack on order now and will do it right when it gets here. I would politely suggest that you forget trying to use the 1N914 unless you have a micro-miniature repair facility at hand. (I did and still didn't like it).

To avoid hate mail .... I have to remind you that it is illegal to transmit on the air with this radio out of the Amateur Bands unless a legitimate emergency exists. (Type acceptance and all that.)

However if you (like me) plan on using it for a quick and dirty sig-gen into a dummy load, then it is the cat's meow!

Hello All,

I am only a reader of this newsgroup for the most part. I have
sent personal responses to some of the articles I have read, but the
Increasing CW speed, no CW, next best thing to CB radio with technically
minded people articles are quite frankly 90% of what I see now.

I dont believe that the net was intended for the purpose of training
debate teams but it is quickly heading that way.

In the future I believe that there will be a no code class if
for no other reason than the fact that human nature makes us use our
minds to figure a short cut method to attain our desired results. Someone
will get it pushed through one way or the other.

I learned the code. I can still use it. I seldom use it. I dont
think it is a barrier that cannot be overcome by even the dumbest of us
idiots (Paul Flaherty's name for whom ever lights his flame). I do believe
that some dont want to be bothered by something so trivial as code and these
are the ones who will push it into a no code class sooner or later.

I think we should start another net. We can call it:

REC.HAM-RADIO.DEBATE
This way those of us who wish to read these debate team training
articles can and the net can be freed up for technical questions and not
opinions and critical analysis of every word in an opinion.

Of course I am expressing my opinion which is not worth a hill
of straight keys to the next guy, but as a future practice I'll just
not read this type of article as I am sure Paul will inform me
that I done have to if I dont like them. I'll just save all of you
out there the time of writing the response.

Thanks for the time. Hope everyone has a nice day in the Ham Radio
World.

TGOB

In article <54050@bbn.COM> chartnes@vax.bbn.com (Clark Hartness) writes
a whole bunch of pollyanna-ish sweetness and light followed by
> I think we should start another net. We can call it:
> REC.HAM-RADIO.DEBATE
> This way those of us who wish to read these debate team training
>articles can and the net can be freed up for technical questions and not
>opinions and critical analysis of every word in an opinion.

Sorry, Clark, we won't shut up and go away. If you're uncomfortable
with what you hear, the fault lies in yourself. No-code is a valid
subject for debate: we supporters believe passionately that we have the
very best interests of ham radio at heart. I don't think you do; I
think you just want to be left alone and not have your irrational
beliefs challenged because it makes you uncomfortable - no doubt
because you realize that your position is not supported by the evidence.

CW is dying, and the only regret I have about that is that those who
support it as a mandatory requirement aren't dying with it.
- Brian

1840. Increasing CW Speed

From: mgb@TECNET1.JCTE.JCS.MIL
Message-ID: <9003250020.AA12799@tecnet1.jcte.jcs.mil>
Source record: 12640

In article <9003231820.AA29999@ti.com> dube@cpdvax.csc.ti.com (DUBE TODD)
> I submit that MOST of the arguments that have been presented in
>opposition to the CW requirement could JUST AS EASILY be applied to any other
>entrance requirement, including examinations. Just plug in your favorite
>hang-up in place of "CW" in all the preceding arguments and see how it comes
>out.

shelby!neon!bodega.stanford.edu!paulf@decwrl.dec.com (Paul Flaherty) replies:
>Obviously untrue. While you can operate an hf station without knowledge of
>CW, you can't do so reliably (if at all) without some knowledge of technical
>detail or regulations.

While pretty much trying to stay out of this worn out discussion, I really have to say that I agree with Dube Todd 100% on the point that he has made in his posting. There are some good arguments for no-code, but some of the ones read on here lately are pretty poor and Dube is right on line with his comments as far as I am concerned.

Paul, your comments about not being able to reliably operate modern HF rigs "reliably (if at all) without some knowledge of technical detail or regulations" is a joke. Many... I say again ... MANY MANY ... gosh darn it *MANY* CB operators are doing just the very thing that you are talking about AS WE SPEAK! You plug in the radio, you read a little bit of the manual... you hook up a mike and you turn it on! I am talking about amateur gear here Paul... there is nothing complicated about operating it now-a-days other than possibly keeping it on the right frequency, more on that line in a minute!

There are a LARGE degree of licensed amateur operators that also do this very same thing. They learn the regulations and the theory the way that Phil Howard says he learned CW. I.E. Just enough to get by and pass the test with absolutely no intention of trying to actually LEARN the stuff. After all they don't WANT to be "techies" they just want to TALK, and they see no need to spend hours and hours trying to understand what a Phase Locked Loop is or how it works. These people may perform tremendously in public service events but in some cases, putting a connector on a piece of coax is beyond them. I point as proof of that to the recent embarrassments we as ham operators suffered during the latest DX frenzy as well as personal experience.

Your comments are just not true Paul. This is not a flame at all, it is just an observation of the real world that says that about anybody that has the desire and the $$$ can make a HF rig work. And as you can see from my above paragraph, the same argument that some have been using to condemn CW applies just as well to all other portions of the test.

I like a no-code license... I don't like doing away with Novice and Tech.
to get a "Communicator Class", but if that is what it takes... well ok.
One of my worries is that before too much longer, the theory test will be
the next thing to go for EXACTLY the reasons that Dube pointed out.

Message-ID: <a1ckg1w161w@w8grt.nstar.com>
Source record: 12641

Let's drop the argument. Code can be useful. Code can be fun for those who like it. Big deal! That does not by itself make it necessary to require testing on code proficiency on VHF only licenses. Noone is going to change anyone else's mind on those points.

But NPRM 90-55 is up for consideration and comment. It seems almost 100% certain to be approved. Let us therefore limit our arguing to the more constructive issues of how best to implement no-code. Pax?

SpaceNews
=========

MONDAY MARCH 26, 1990

SpaceNews originates at KD2BD in Wall Township, NJ, and is distributed weekly around the world on USENET and Amateur Packet Radio. It is available for UNLIMITED worldwide distribution.

* MUSES-A NEWS *
================
Hiten (MUSES-A) made the first lunar swingby at 05h04m09s JST (UT+9h) on 19th at the distance 14,073km, 27 minutes earlier Hiten separated a lunar orbiter and its rocket put it in lunar orbit. The orbiter was named HAGOROMO, which means "angel's robe" in Japanese.

[Source: The Yomiuri Shimbun, March 19 evening edition]

* DOVE NEWS *
=============
N4HY reports that the crash of the DOVE computer which had caused the key-down condition has been brought under control. The DOVE transmitter was blocking the uplink command channel and the software crash was inhibiting the on/off cycling of the transmitter.

The solid key-down condition caused DOVE's batteries to discharge far enough that Dave, W5UN was able to send a special "hard reboot" reset command using his moonbounce (EME) antenna array in Texas.

Congratulations and thanks to W5UN and N4HY for their heroic rescue efforts.

[From: Tom, W3IWI via Amateur Packet Radio]

* AMATEUR RADIO ACTIVITY FROM MIR *
===================================
Soviet cosmonauts Anatoly Soloviev (U6MIR) and Alexander Balandin (U7MIR) began Amateur Radio operations from the MIR space station on March 9th, according to Leo, RA3AT.

Most activity is expected to occur on or near 145.500 MHz FM, with operations occuring after 18:00 UTC on weekdays and anytime on weekends.

QSL cards for this operation are available via UW3AX at P.O. Box 679, Moscow 107207, USSR (S.A.S.E. please).

* SHUTTLE NEWS *
==========
KSC SHUTTLE STATUS REPORT - THURSDAY, MARCH 22, 1990 - 11:30 a.m.

STS-31 - DISCOVERY (OV-103) - LAUNCH PAD 39-B

This morning, workers successfully completed loading hypergolic propellants into Discovery's onboard storage tanks and the pad has been opened for normal work. Monomethylhydrazine and nitrogen tetroxide propellants were loaded into the orbital maneuvering system and reaction control system storage tanks. Hydrazine was loaded into the orbiter's auxiliary power unit storage tanks and the boosters' hydraulic power unit storage tanks.

Today, engine technicians will inspect a teflon coated seal at the joint between the engine 2 low pressure fuel turbo pump and the orbiter main propulsion system. A leak was detected at this joint during the helium signature test. This is a 12-inch diameter line at the engine to orbiter interface.

STS-35 - COLUMBIA (OV-102) - OPF BAY 1

Electrical connections between Astro and the orbiter are continuing and testing will follow. Connections of the Broad Band X-ray Telescope are underway today. An engine flight readiness test was conducted yesterday. During this routine test, engine start is simulated, valves are cycled and sensors and transducers are calibrated.

This week, checks of the water spray boilers, Ku-band antenna testing and leak checks of the elevon cove seal area are underway. Thermal protection system operations are continuing around the S-band antenna and landing gear doors.

> ^^^^^^^^^^^^^^^^^^^
> This is off the original subject by far, but the above caught my eye.
> Does the average person these days *have* 2 photo IDs?

I usually use a driver's license and a US Passport when I need ID for something I'm prepared for. But I would wager that *most* Americans don't have a Passport. (They aren't very useful if you don't travel.)

> I'm guessing many non-drivers may not have *any* photo ID.

Every state I have lived in for the past 5 years or so has issued state ID cards to non-drivers. They usually cost a couple of bucks.

> Does this requirement cause any problems? Anybody else out there have
> comments on the issue of photo-ID?

The VECs at my last test checked to see I had the conformation slip for my test time and my driver's license. That was all. The FCC checked my conformation slip and that I had my own pencils for my commercial test. I could have had Nikoli Tesla take my test for me.

> his call without passing the code test. NO! There are no hams who have
> obtained their tickets under existing rules who are INCAPABLE of learning the
> code.

I see you did not read AND ABSORB the posting I replied to. I did NOT LEARN
Morse Code, I memorized it enough to pass the exam. This kind of practice
is what Ken was complaining about. I was only trying to show that it is in
far more common practice than he realizes.

The incapability is based on the fact that the test is a 5 WPM test which
does lend itself to LEARNING Morse Code, but only to MEMORIZING it. To
really KNOW Morse Code, you will be able to copy in your head at speeds
well above 20 WPM. The incapability is not IN ME, but rather IN THE SYSTEM.
Sorry I did not make that clear.

You next commented that inability to learn should not be related to
motivation. Since you missed the point in comparing the two postings,
I won't count that useless argument against you.

> But onward to another point: Let's say that the CW requirement had been
> dropped in 1929. I submit that there would have been in the intervening years

> out.

If you submit that most of the arguments against a code test can be applied
to the real requirements (which are NOT necessarily what are actually being
tested today, BTW) then please post the specifics. I happen to believe there
are none, and /dev/null is my basis of proof.

So, what if the CW test had been dropped in 1929? I suspect the military
and the maritime services would probably have been LED by Amateur Radio into
phasing out CW in favor of new technologies instead of the current case where
THEY are leading US. CW would NOT have gone away, and I don't expect it to
even if EVERY class of license becomes no code.

> over 220-222 MHz, how many owned computers, what was their favorite
> band (mine is the Rolling Stones), and what is their favorite mode.

If ARRL only surveys its members, that tells you information ONLY
about its membership. It certainly does NOT tell you much about
the ham radio population as a whole. The ham population is a
selected population in the first place, since it consist of the
union of two sets: those who think the code test is wonderful,
and those who, like me, said W.T.F. and went ahead and took the
stupid test (many of whom passed it without learning anything useful).
Further the ARRL membership, due to the alienation the ARRL has
caused to some in the past, does not represent the ham population;
and certainly one division does not.

One group of people who are left out altogether are those who could
and would make significant and important contributions to amateur
radio in all areas except increasing the number of DXCC-CW awards
given out. They are not members of the league and are not even
licensed due to their frustrations with those hams who would have
them become interested in only a narrow range of the hobby.

> By the way, regarding favorite bands, 30% chose 2 meters, 24% chose

Gee, that's close to the proportion of LIDS on the bands.

Hmmm, now that's a GOOD IDEA!!!

Seriously, the field strength in your neighbors house follows the inverse square law for distance given a constant lobe-angle parameter, which is not constant as the antenna goes higher; it further reduces the field strength. Even hams want less of their power being dissipated in the various bizarre radio receivers their neighbors have by other names.

> I'd like to see a study done where they control for the kind of antennas
> the hams had to use. Now THAT would be interesting! I would not be
> surprised if the relationship was increasing health problems with
> decreasing antenna height.

A simple field strength study might do fine in many cases as well. I know if I lived next door to a ham, I'd at least want out antennas at differing levels to avoid overloading each other.

TO: rusty@cadnetix.COM (Rusty Carruth)

C6Anyway, I logged 2 German stations, and one Lithuanian on 10 meters
C6last saturday! My first European station!!!!

Congratulations!

C6(All this with about 100 watts into a 5/8 wave groundplane mounted
C6about 30 feet off the ground! ON SSB!)

I spent my first year on the air with a TenTec Argonaut and a ground
mounted vertical. While I missed a lot, you don't need power all the
time.

C6(Editors note: please excuse my excitement, but I never thought I'd
C6ever work "real dx" until I upgraded and had 'real power', or
C6switched to CW, or a 'real antenna', or .....)

You'de be suprised what moderate equipment can do. How about Easter
Island on 2 watts and a dipole? Or Minneapolis on 100 milliwats and a
1/4 wave whip?

C6Which reminds me - I had an email message a while back which said that
C6I should not work HF SSB because it would ruin my upgrading. Not so!
C6Making contacts on HF only makes me fear the time when 10m becomes a
C6local-only band... No way do I want to be a Tech when the sunspots
C6change! This is too much fun!

Well, if you do it exclusively your code speed suffers from lack of
practice but don't give it up. Sideband techniques take some practice
too.

Enjoy!

Which side are you addressing? (I think I know)

> But NPRM 90-55 is up for consideration and comment. It seems almost 100%
> certain to be approved. Let us therefore limit our arguing to the more
> constructive issues of how best to implement no-code. Pax?

Are you so certain? Without exception, every person I know who is in
favor of a no code license is against the particular way that 90-55
proposes to do it. Fortunately the regulatory process does allow for
changes to be introduced between the Notice of Proposed Rulemaking and
the Final Notice of Rulemaking without having to start the process all
over again. This is why comments rather than mere votes can be filed
on the matter.

I have already come up with NINE alternatives to the 90-55 proposal, and
plan to include them all in my comments. I also suspect that 90-55 will
exceed even 87-14 in the total volume of comment filings.

Sometime in the early seventies, STORNO was bought by General Electric.
So you may find that some GE repair shops may have STORNO Docs. GE sold
STORNO a few years ago when they decided they could make more money by
shuffling money (banking) than by making stuff.

STORNO is a Danish company. They made some excellent gear, including
the walkie-talkies used by the London Bobbies. STORNO used to be a
subsidiary of STOR NOrdisk Telegraf (Great Northern Telegraph GNT). Yup
the people that made those Morse code punched tape machines.

If you have trouble getting STORNO docs from a GE shop, you could
write to a Danish Ham that used to work for STORNO and may still have
contacts there:

I'd urge anyone with even the remotest chance of traveling out of the country to get a passport. Believe me, they're a *lot* easier to get when you're not in a hurry. They're not that expensive, they do come in handy as a very credible form of ID, and even when traveling to countries like Canada where they're not strictly required, they're nice to have.

I'm afraid HF packet is a dead issue with me. I'm not qualified to operate that mode. It doesn't seem to matter that I am responsible for all of the digital communications where I work, or that I am duly licensed to operate our HF tranmitters. The problem is that, because I have never been one bit interested in code, I'm obviously too stupid to understand HF packet.

But if I were to wind up in a prison camp and forced to brush up on my code through the heating pipes, I'm sure I could win the Nobel prize for all of the advances I made in digital communications theory while locked up.

Yes, but the CB operators aren't doing so reliably. Ask a CB op about MUF.
At least, most hams know enough to listen to WWV to catch the propagation
bulletins, and to understand what they mean. Most hams also know what band
to be on at about what time to work into a particular part of the world.
Most hams build their own antennas, and know enough to look at the SWR meter
now and then to make sure that the antenna system is radiating. Most hams
know something about RFI and TVI, and how to get rid of it (now there's
something our appliance ops don't know!).

Personally, I'd like to see the written exam changed to make the regs part
tougher. But as it is, most hams again know the rules and follow them.

There's a big difference between the so - called appliance operators, and
a decent HF operator (and an experimenter). Hams generally qualify as
decent HF ops, since they do know at least a little about how the system
works. Clearly, most hams are not experimenters, but to belittle them
because they don't build their own hardware is unfair.

1854. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-03-25 22:04:24 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9003260803.AA13170@ucbvax.Berkeley.EDU>
Source record: 12650

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

In article <9003231820.AA29999@ti.com> dube@cpdvax.csc.ti.com (DUBE TODD)
> I submit that MOST of the arguments that have been presented in
>opposition to the CW requirement could JUST AS EASILY be applied to any other
>entrance requirement, including examinations. Just plug in your favorite
>hang-up in place of "CW" in all the preceding arguments and see how it comes
>out.

In my opinion, the popularity of this argument shows that American amateur radio is in serious trouble.

The only way your argument has even a tiny bit of truth is if your view of amateur radio consists purely of appliance-style operation. But if the intent of a license exam is to see whether an applicant is capable of furthering the basis and purpose of the amateur service (as opposed to merely chewing the rag and collecting QSL cards), then there is a world of difference between the CW and technical requirements.

There are many ways you could further all of the reasons amateur radio exists without ever using (or knowing) the code. The same is definitely NOT true of the technical and regulatory knowledge one is required to have to become a ham.

In response to your likely rejoinder ("But wait! What about people who are interested only in public service?") I would say two things. First, the amount of public service traffic carried by CW is nil; the action is on the voice and packet nets. Second, although "public service" is a motherhood-and-apple-pie issue that moves many hams to heartfelt expressions of civic devotion (especially when battling tower ordinances or spectrum grabs), the cold, hard fact of the matter is that we're losing ground VERY rapidly to the competition, and I wouldn't bet the future of our service on it.

Our mainstay in the "public service" area for the past twenty years has been the FM repeater club whose members call in highway accidents and provide communications for the local March of Dimes Walkathon. In that twenty years, our technology has remained essentially unchanged. (Yes, we now have "pinball machine" computerized repeater controllers and synthesized HTs, but the basic "service model" of an FM repeater/autopatch is the same today as it was in 1970). But the outside world has changed: a lot of people without ham tickets are now just as capable as we are of calling the police (or each other) from their cars. In my area (NNJ/NYC) I can say that cell phone antennas outnumber every other kind of mobile two-way antenna by a *very* healthy margin. (One sign of this change: nobody asks me any more if my HT is a CB or if I'm a cop; they ask what kind of cell phone it is.)

I am not trying to attack amateur radio public service per se; it is certainly most worthwhile. It's entirely possible that our liberal

allocations vis a vis the rest of the world are due in part to our tradition of public service, something unheard of in many other countries.

My point is that public service is by no means sufficient to justify our service considering our stagnant technology and the much wider variety of alternatives now available to the public. If amateur radio is to survive, it will have to place far more emphasis on the other reasons it exists. In particular, amateur radio as a unique training ground for young people interested in electronics and communications (and possibly a career in the field) must become its single most important role. But if this is to have a ghost of a chance of happening, amateur radio is going to have to make some MAJOR changes. The no-code license is but the first step.

Phil

1856. No/Pro CW

I feel that I am not alone in expressing a general dissatisfaction in the way that the code and no code discussions are now headed. It seems that the way to win an issue now-a-days is to make the other person look as stupid as you can and to throw names back and forth at each other.

Even people that DARE to suggest that the discussion be toned down a little are "FLAMED". Various labels are generated on both sides and the issue has degraded into one of name calling. There has even been some innuendo that a PRO-CODE person is better off DEAD.

ISN'T THIS JUST A LITTLE BIT TOO MUCH?

It is my honest opinion (IMHO) that there are certain elements that are using this forum not to argue their points on the no/pro-code issue, but to show everyone how good they are at making other people look stupid. There is no effort in trying to understand the real meaning behind some-one else's points, rather there is an effort to take advantage of any little slip or mistake in what a person says in public in order to baste him (or her) over the charcoal pit of public humiliation.

Keep one thing in mind. No one that I have ever known LIKES to be made to look stupid in public. I for one ALWAYS sympathize with the person that is getting the tar beat out of him by some slick tongued devil, and I submit that the people that are doing this are causing more harm to their cause than they can possibly imagine.

So the thought then comes to mind.... Are they really using this type of behavior to PROMOTE their cause, or are they just trying to feel smug and self-content in the knowledge that they are the KING of FLAME-THROWING?

Notice that I have been careful in trying not to point a finger at any one faction. Keep this thought in mind when my little posting here comes under attack from one side or the other. The person that attacks what I have written here is the one that is guilty of what I have been saying.

Let's watch and see.

Mark Bitterlich WA3JPY Is it better to fight fire with fire
mgb@tecnet1.jcte.jcs.mil or to use a CO2 extinguisher?

1857. Phone Frequencies

Can anyone tell me what are some characteristic frequencies that the following operate on:
1.)Cellular phones
2.)Cordless phones
I have monitored High Seas Ship/Shore, but have nevered monitored other phone calls below 30 Mhz.

I plan to propose adoption of the Canadian Plan as is except for
modification of the homebrewing restrictions.

RTTY DX Notes, 1of3, 3/23/90

RTTY DX Notes for Weekending 23rd March 1990.
Part 1 of 3.
BID: $RTDX2303

It seems that this week will be the week for DXpeditions. They will
be appearing from some very exotic places, so keep the fingers
sharpened up and the screen alive at all times. Regarding the remarks
last week about the JT0DX cards, it seems that some German stations
have received theirs this week. While there is life there is hope.
ZS8MI cards of course are another matter. They will be issued when
the operator returns home to ZS6PT.

Our thanks this week go to I5FLN, JA1BLV, JG1NBD, KT7H, OD5NG, TG9VT,
VE3JPC, VK2EG, W2JGR, W5KSI, and the Tri-State DX Association VHF
packet cluster. Thank you all for the good DX reported.

SB ALL @ RTTYDX $RTDX2503
RTTY DX Notes, 3of3, 3/23/90

RTTY DX Notes for Weekending 23rd March 1990.
Part 3 of 3.
BID: $RTDX2503

AP2NK is Nasir Hkhan, Box 1944, Islamabad, 4400, Pakistan.
A51JS (yes, it is Jim Smith) will QSL via VK9NS.

Notes Of Interest:

Well, as you can see from the DX notes, Jim Smith has arrived in Bhutan and is active. He will be there for about three weeks, then he hopes to go to S2 (Bangaladesh). More later.

There is a report that A61 (United Arab Emirates) should be on this week, for about 2/3 day operation.

Abu Ail A15 also should be active this week, according to DJ6JC who will also have DJ6SI and DK2WV to help fighting the DX and helping with the keys. This is possibly the last operation of this callsign, as the light house is being taken over by the Yemen authorities at the end of the month.

Mayanmar (Burma). It is reported that a Hungarian group will operate from there from 22nd March for 14 days.

March 29 also sees AA6HT and KC6XDP operating from V29 until 9th April.

April 11th to 15th will see Aves Island on the air, only digital modes.

April 11th to 23rd will see Jarvis Island activated. Send donnations to P.O. Box 2368, Stanford , CA 94309-2368.

Off again, on again, Spratley is on again sometime in April. They will operate from Vietnam before and after the Spratley operation, we hope.

Western Sahara. There will be no RTTY operation during this trip, sorry to say. Maybe later.

GL DE DX1 (VK2SG).

I've been licensed 39 years this coming Friday. The original renewal
requirement then was you had to certify that you had operated x hours
(6 comes to mind) AND that you could still copy CW at the speed
required for granting your grade of license. In theory the FCC could
ask you to prove it. I never heard of anyone who was actually asked to
do so. As you said, the minimum on the air time did not have to be CW,
but of course the ARRL always thought it SHOULD be and so recommended.

Actually, this wouldn't be too bad. 200 mm == 20 cm =~ 1.3 GHz. This would include everything higher in frequency than our current 23 cm band. Certainly, we would have a lot more bandwidth than we now have! I personally wouldn't miss the loss of the DC (HF) bands, but I would miss 432 MHz. Of course, I'm sure we could learn to use 1.3 GHz for coordination.

Aurora can only be effectively utilized if CW is used.

During contests, I can do a CW contact in about 1/2 the time a voice
contact takes, and I never have to ask for a repeat.

Once, about 10 years ago, I copied a distress call from someone who went
down in an airplane, near Mansfield, OH. Since the signal was CW in a
phone band, it stood out like a sore thumb and attracted my attention
very quickly. I was able to help out these people by calling the local
FAA and giving them the details. A signal in any other mode would not
have attracted my attention (or anybody else's) like it did. (Note: it
was a very weak signal, and I doubt that it would have been copyable if
it wasn't CW.

The CW mode is very useful. I could go on, but I don't think you want
me to.

I used to be very active on these bands, but I am temporarily off the air. I have quit my job and returned to school for a PhD. The lack of funds and (even more importantly) time has, and the desire for a PhD, has caused me to re-evaluate my priorities.

P.S. I wasn't on 47 GHz, but I was working on 76 GHz.

WO-18 TAKES EARTH PICTURES

HR AMSAT NEWS SERVICE BULLETIN 055.01 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 24, 1990
TO ALL RADIO AMATEURS BT

WEBERSAT-OSCAR-18 Successfully Takes Pictures Of Earth With Its CCD Camera

Chris Williams (WA3PSD) reports from the Weber State University (WSU) Ground Command Station in Ogden, UT that WO-18 took several excellent pictures from outer space this week with its onboard Charged Coupled Device (CCD) camera experiment. One picture of particular interest was of the Indian Ocean which, after color recovery by WEBERWARE 1.0 software, showed plenty of blue ocean and lots of clouds. Since it has been determined that the CCD camera is working well along with the rest of WO-18's satellite subsystems, officials at WSU's Center for Aerospace Studies (CAST) have declared WO-18 to be a major success. Two weeks ago, however, it was not definite weather the CCD was working properly since the first few pictures were either totally dark or completely white. After investigation, it was theorized that the camera lens was either pointing off to deep space or straight at the sun! Once the schedule for taking pictures was randomnized a bit, WO-18 finally was pointed at the earth when a picture was taken of the Himalayas. Since that first good picture on February 18th, WSU students have eagerly awaited each pass to see what new pictures of the earth will be seen. Chris reports that with each pass of WO-18, they are collecting about 100 Kbytes of data. They have now collected so much imaging data that they are running out of disk storage space.

Early in the week of March 13, WSU will be releasing its Beta test version of WEBERWARE 1.0 software for general use. This software will be available from the AMSAT Software Exchange as soon as it is released. Radio amateurs are encouraged to continue to collect imaging data from WO-18. Watch for more information about the release of WEBERWARE 1.0 in future AMSAT News Service (ANS) bulletins.

MICROSAT UPDATE

HR AMSAT NEWS SERVICE BULLETIN 055.02 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 24, 1990
TO ALL RADIO AMATEURS BT

Week five at the AMSAT Satellite Factory (tm) finds the Engineering Team focusing their attention on investigations of the spinning motion of each satellite and the accompanying effects on solar cell illumination and temperature. All four satellites have some degree of wobble motion in addition to spin and magnetic lock. Jim White (WD0E) and a number of other volunteers have put forth considerable effort aiding W3GEY, N4HY, and NK6K in evaluating the telemetry from each satellite to characterize its various motions.

AO-16 seems to have the most wobble of all the MICROSATs. It currently has a rotational period of 690 seconds (which is fairly slow) and a wobble of about 45 degrees. LO-19 takes about 270 second/rev and has a wobble of about 20 degrees. DO-17 is the most stable of all the satellites with its 20 second rotational period and a wobble of about 12 degrees. Data on WO-18 is still being analyzed. Because WO-18 has two additional trays (a total of 7 electronic platforms) its spin characteristics are more complex and will require further study.

Because of the shortage of real estate and modest power budgets, none of the MICROSATs has an active attitude control system on board e.g., magnetorquing coils such as those used on AO-10, UO-11, AO-13, and UO-14. They do, however, have a set of bar magnets placed along each of the four corners of the spacecraft which will provide some alignment with the earth's magnetic field and will ultimately damp the wobbling motion. In addition, the 70 cm antenna elements on each satellite are painted black on one side and are silver coated on the other side. The purpose of painting only one side is to generate a slight rotational torque due to solar radiation on the MICROSAT to keep the satellites rotating. This solar torque drives each satellite in constant rotation and thus prevents one part of the spacecraft from becoming too hot or too cold.

Once it has been determined that each satellite's battery charging and temperature parameters have stabilized, preliminary operating schedules will be drafted and the satellites released for general use. Look to ANS for late breaking news on the commissioning of the MICROSATs.

AO-13/AO-10 TRANSPONDER SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 055.03 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 24, 1990
TO ALL RADIO AMATEURS BT

New AO-13 Transponder Schedule thru 09-May-90

Mode-B : MA 000 to MA 165
Mode-JL : MA 165 to MA 195
Mode-S : MA 195 to MA 200
Mode-BS : MA 200 to MA 205

Mode-B : MA 205 to MA 256
Omnis : MA 240 to MA 060

BLON = 207.3 and BLAT = 2.3 for 05-Mar-90

From 21-Feb-90 to 21-Mar-90 there will be an OFF period from MA 20 to MA 90 due to solar eclipsing. The length of eclipses vary from 12 to 89 minutes. Only the Mode-S transponder and the Mode-B beacon will be on from MA 195 to MA 200.

AO-10 is currently experiencing solar eclipses during major portions of it orbit and until further notice its transponder is not available for use.

FO-20 PROGRESS REPORT

HR AMSAT NEWS SERVICE BULLETIN 055.05 FROM AMSAT HQ
SILVER SPRING, MD FEBRUARY 24, 1990
TO ALL RADIO AMATEURS BT

FO-20 Progress Report

The news this week from JARL is that FO-20's electrical power subsystem (EPS) is performing better than expected. With FO-20 having been on orbit for almost three weeks, the Mode JA and JD transponders have been operating simultaneously. In the case of Mode JD, there is the additional current drain caused by having 1 Mbyte of RAM memory also on line. JARL Ground Command Station operator JK1VXJ reports that with both transponders are operating and all the RAM memory banks are on line, the power used is only slightly more than the EPS system can deliver. He also says that when

FO-20 is in a full-sun condition, the EPS system can deliver the power necessary without any problem. Another interesting aspect to FO-20 life so far is the number of Single Event Upsets (SEU) or bit flips caused by high energy particles bombarding FO-20's RAM memory banks. The Error Detection and Correction (EDAC) circuitry has now recorded at least 3 to 5 bit flips due to this phenomenon. The EDAC circuitry can correct only one bit flip at a time per byte of memory.

From a Mode JD operation standpoint there is a problem that JK1VXJ would like to bring to the attention of all Mode JD users: a problem called "ZOMBI's." This term refers to stations that connect to FO-20's packet radio Mode JD mailbox system but do not send a disconnect before they have Loss of Signal (LOS). By typing the letter U when connected, JK1VXJ says he sees that there are still stations connected to the packet transponder. After a while, when the number of connected stations reaches 16, JK1VXJ says that even the Ground Command Station cannot connect! When operating Mode JD, please be sure you disconnect before LOS.

JK1VXJ reports that as of last weekend (17 February) he had reached the following milestones:

1. The BBS program written for FO-12 is now modified so that the CPU utilizes the full 4 RAM banks or 1 Mbyte total of memory. The modified BBS program was loaded to FO-20 during the February 17th weekend.

2. The ground based FO-20 software loader was also modified to improve its efficiency.

3. The ground based FO-20 engineering model is now operational and is serving as a test bed for "soon to be" loaded on-board software.

4. The Whole World Diary (WOD) function is added to BBS program and the program is being evaluated on the engineering model mentioned above. This "BBS with WOD" program will be loaded to FO-20 shortly.

SA AMSAT BACAR ATV MISSION

HR AMSAT NEWS SERVICE BULLETIN 062.01 FROM AMSAT HQ
SILVER SPRING, MD MARCH 3, 1990
TO ALL RADIO AMATEURS BT

SA AMSAT Balloon Experiment To Carry Amateur TV Camera

SA AMSAT's BACAR (BAlloon Carrying Amateur Radio) mission 90/1 scheduled for March 10 will carry a black and white closed circuit television camera that

will be mounted in the flight package so that it faces towards the earth. The camera will drive a low power amplitude modulated video transmitter operating on channel 35 in the UHF television band. The output from the transmitter will provide a usable ground signal for distances up to 500 Km away from the package.

The most exciting portions of the mission will be the take off and landing as the pictures will contain most detail at these times. When the package is flying the picture on the ground will show large objects such as dams, major roads, mountains, valleys and heavily populated areas. The intention is to use a lens that will give ground coverage of some 10 Kilometers across from the altitude that the package is expected to reach.

All that will be necessary to pick up signals is a normal black and white television set tuned to channel 35 and equipped with a suitable antenna. SA AMSAT recently petitioned the South African licensing Authority for permission to use TV channel 35 as it will encourage youth groups and young amateurs who do not have sophisticated equipment to participate.

[ANS thanks SA AMSAT for this bulletin]

MICROSAT Status Report

The work accomplished during week six of the AMSAT Satellite Factory (tm) brings closer the time when the satellites are fully commissioned for general use. Chris Williams (WA3PSD) of Weber State University reports that WO-18 Photo-04 is another keeper. It was taken over the north coast of the Bay of Bengal. It is mostly clouds, but the right side of the screen has them thinned out a bit and some faint detail of land can be decerned (with a trained eye).

AO-16's S band beacon is being activated. If a number of key telemetry parameters are within specified windows, the beacon will be left on for a period of time.

It has been determined that the power module version of the +10V bus for DO-17 is reading faulty. The AMSAT Engineering team is in the process of recalibrating it. Jim (WA4ONG) has been "manually" charging the batteries on DO-17 to top them off in anticipation of activation of the voice transmission experiment on DOVE. Jim has managed to bring the TRUE battery voltage up almost 0.5 V in a short period of time. It is hoped that this next week will bring DO-17 closer to full commissioning.

MICROSAT UPDATE (PART 2)

HR AMSAT NEWS SERVICE BULLETIN 062.03 FROM AMSAT HQ
SILVER SPRING, MD MARCH 3, 1990
TO ALL RADIO AMATEURS BT

MICROSAT Status Report, PART 2

The AO-16 and LO-19 digipeaters have been turned on for use. Ralph Wallio, W0RPK, reports that he was able to connect to himself thru LO-19. While he was doing the normal things one does when first starting in Packet Radio such as sending yourself "Hello" and "Test" packets he received a *** Connect request from N4HY. Ralph quickly disconnected himself from himself (no comments please) and reconnected to N4HY.

On the LSTAT telemetry line now there is a new item which has the form of "d:n"; "d:0" means the digipeater is off, "d:1" means the digipeater is on. Telemetry normally comes down one each 10 seconds. When a packet is being digipeated, the time interval becomes 30 seconds. This is a compromise between those people who are using the digpeat function and those people who are looking simply to to copy the telemetry. The AMSAT Engineering Teams asks to please check the downlink BEFORE you transmit. If telemetry is coming down each 10 seconds, then look at the LSTAT line. If d=0, DON'T TRANSMIT. If you see other digipeat activity, then the digipeater is on, and it is OK to transmit. You must specify the spacecraft callsign as a digipeater to get digipeated, e.g., PACSAT-1. This is because there are multiple spacecraft on a specific frequency. N4HY advises that AO-16 and LO-19 will be unavailable at a moments notice and without warning at times as the AMSAT Engineering team is still uploading code.

Initial use of the AO-16/LO-19 digipeater has found that an AO-13 style 10-13dbi gain antenna and 10 watts are all that are needed to access a MICROSAT AT THE HORIZON. More power is not required. Deviation of your transmitter should be set to 3kHz. Also, if you can track your uplink with a program, track in the smallest units you can. Some radios can track through the serial link in much smaller intervals than can be commanded thru the front panel. Set your program to generate the data in small intervals as well. Success has been shown (using 6 seconds (.1 minute)) intervals with QuickTrak and Kansas City Tracker.

HR AMSAT NEWS SERVICE BULLETIN 062.04 FROM AMSAT HQ
SILVER SPRING, MD MARCH 3, 1990
TO ALL RADIO AMATEURS BT

INSTATRACK Satellite Data Base Anomaly

Users of InstantTrack who acquired element sets soon after the new birds were launched should check MICROSAT and UOSAT data carefully. Until this past weekend the object names for several of the birds were incorrect. This was

the result of the mis-labeling that occurred at NORAD early on. Now that NORAD has corrected the labels, the element sets are correctly tagged with the proper satellite.

The mis-labling of our new satellites by NORAD has created a mixed identity problem for InstantTrack users. For example, prior to the correction, object 20437 was identified as UO15. Well, in fact, 20437 is really UO14. However, if you have loaded recent element sets into IT you will get a satellite selection menu entry of UO15 actually loaded with UO14 elements. This problem will most likely occur with UO14/UO15/AO-16.

InstantTrack loads satellite elements by looking at the OBJECT NUMBERS and matching them to the object numbers in its database. It assumes that when you load the new elements for object 123, you want it to replace the data you presently have there for object 123. InstantTrack makes a second assumption. It assumes that when you load new elements for an object already in he database, you want to KEEP THE OLD NAME for the object. The reason for this is simple. The same object often goes by many different names. EGAP vs Ajisai. AO-13 vs Oscar-13. UO-11 vs UOSAT-2, etc.

The correct present relationship between object name and object number has been published several places recently. All you need to do is look at the name and object number for each MICROSAT. If they don't match the published relationship, then EDIT THE NAME ONLY. InstantTrack will already have loaded the correct orbital elements with the correct object number.

SILVER SPRING, MD MARCH 3, 1990
TO ALL RADIO AMATEURS BT

UOSAT-OSCAR-14 Status Report #006 2-March-90, Part I

We apologize for the long delay between the last report and this one. The team at UoS has been very busy working toward the full commissioning of UO-14 and also trying all avenues toward the recovery of UO-15.

Firstly, happy birthday to UoSAT-OSCAR-11, now completing its 6th year in orbit! Congratulations to the international team which built this successful satellite.

UO-14 Attitude Control and Stabilization

UO-14 operations for the past month have concentrated on maneuvering the satellite into an attitude suitable for extension of the gravity gradient boom. On UO-9 and UO-11, these preliminary attitude control operations were conducted mostly under direct control of the Surrey Command Station, with only simple on-board computer programs. On UO-14, these operations are being conducted autonomously by the 1802 On Board Computer (OBC). This transfer from manual to automatic control has been made possible by extensive experimentation using UO-11, and development of complex autonomous attitude determination and control algorithms in the FORTH DIARY. These operations have been going well, if a bit slowly. University of Surrey's spacecraft attitude determination and control expert, Mr. Hodgart, has extensive lecturing and administrative commitments at the University, so software modifications and data analysis have sometimes been delayed.

In our last report, UO-14 was in a "flat spin", with the spin axis lying in the orbit plane, roughly north/south pointing. The first step was to slow this spin from 18 seconds to several minutes. Once the flat spin was slowed, controllers decided to impart some spin about the satellites Z axis. This is the normal spin motion for UoSAT satellites, and it distributes solar illumination evenly between all of the spacecraft's body mounted solar panels. This assures that no undesirable thermal gradients build up across the body of the satellite. Although control of Z axis spin is a regular part of UO-11 operations, it was found that spin control of a non-Earth-pointing UoSAT required some modifications to the OBC software. The desired Z spin rate was achieved during the last week in February.

After imparting spin about the Z-axis for proper thermal control, we wish to lock the Z axis to the Earth's magnetic field. Because of the alignment of the field, magnetic locking places the satellite in a favourable attitude for boom deployment as it makes descending passes over Guildford. Thus, once the satellite locked to the magnetic field, the boom will be deployed within range of the Command station, the magnetic lock software will be disabled, and the satellite should become gravity gradient stabilized. These operations are expected early next week (12 March).

UO-14 Status Report #006 2-March-90, Part II

Data Formats

UO-14 continues to run the FORTH DIARY on the 1802 OBC, using data formats distributed just after launch. The development, publication and implementation of downlink data formats for OSCARs is a delicate business, especially early in a mission. We do not want to publish data formats if they are likely to change quickly, lest people waste their time implementing software which will later become useless. On the other hand, if we do not publish formats, you cannot listen to the satellites - and that's what they're there for!

In the next month, we will be changing operating regimes on UO-14, as the PACSAT Communications Experiment (PCE) is brought on line. Once this happens, asynchronous data formats (as used by the DIARY) will give way to synchronous, AX.25 packet formats.

As soon as possible, the PCE on UO-14, and the BBS systems on AO-16 and LO-19 will be brought on line for general amateur store-and-forward communications access. All three of these satellites will be running the same software, using the same protocols - developed jointly by UoSAT and AMSAT-NA. NK6K and G0/K8KA have already published a draft standard for a broadcast (e.g. bulletins and Whole-Orbit-Data) protocol. A final specification should be distributed soon, and early transmissions from the UO-15 PCE will use this protocol. Specification of the message-transfer protocol is well under way.

Thus, the stable state, which we expect to reach sometime this spring, is that UO-14, AO-16 and LO-19 bulletin boards will be accessable with the same groundstation protocol software. Broadcasts from these satellites (e.g. bulletins and Whole-Orbit Data) will also come down in a single standard data format. Until we reach this state, ground station software developers are advised to make their programs modular and be ready to revise!

Downlink Modulation

UO-15 is capable of transmitting either 1200 baud AFSK (as used on all previous UoSATs and currently transmited by UO-14), or 9600 bits/second FSK. Ultimately, the PCE on UO-15 will support only 9600 bps FSK. During the transition from DIARY operations to PCE operations, however, we will also be transmitting AX.25 packets at 1200 bits/second AFSK. Like DOVE, this should be copyable with a standard, unmodified, TNC.

[AMSAT News Service would like to thank G0/K8KA for this bulletin.]

UO-15 STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 062.08 FROM AMSAT HQ
SILVER SPRING, MD MARCH 3, 1990
TO ALL RADIO AMATEURS BT

UO-15 Status Report #006 2-March-90

Experiments are under way using a large (150ft) antenna at Stanford Research Institute (SRI) to attempt to detect very low level signals leaking from the UO-15's on-board uplink receiver local oscillators. If the spacecraft power systems are still functioning, then these signals should always be present since the receivers cannot be switched off. However, these leakage signals are deliberately minimized during the design of the satellite and so they are very weak (-60 dBm = one thousand, millionth of a watt or the equivalent to looking for a single Xmas tree light in Australia!). The experiments at Stanford are therefore very demanding: it will only be possible to extract the signals from the background noise using sophisticated off-line digital signal processing, and a one second error in antenna tracking time may miss the satellite altogether!

Fortunately, we have UO-14 working well, and this sister satellite can be used as a "reference" to determine whether it is in fact possible to detect these signals even if UO-15 is alive (UO-14 & 15 use identical systems). After much processing, SRI successfully detected the leakage signal from UO-14 on Feb. 26th at the expected levels, and attempts to listen for UO-15 have just commenced. It may still take several weeks before the results are conclusive, since great care has to be taken to remove all sources of error and uncertainty. If the leakage signals are detected from UoSAT-15, then further tests are planned which should allow us to trace the nature of the fault.

[AMSAT News Service would like to thank G3YJO for this bulletin.]

Further on motion...

Analysis of array currents has indicated that PACSAT-1 (AO-16) came out of its tumbling motion after separation spinning in the wrong direction. Because of the dynamics of the separation from the launch vehicle, there was a 50 - 50 chance of that happening with any of the microsats. Once it had locked into the magnetic field of the earth, about 10 days after launch, it began to slowly spin down from about a 10 minutes per revolution rate, to 30 minutes, to 1 hour, then on Feb 17th it essentially stopped all spinning motion for a couple of orbits, then began to turn in the opposite (correct) direction. As of March 3 it had spun back up to about 7 minutes per rev in the correct direction and will probably stabilize at that rate, which is the same speed at which LUSAT-1 (LO-10) is turning. A change in the telemetry gathering method will be necessary to determine if the wobbling motion, much like a top that is a bit out of balance, has been reduced from the 45 degrees measured in early February.

WEBERSAT-OSCAR-18 Picture Taking Continues; Weberware 1.0 Goes To Beta Test

WA3PSD reports that the Ground Command Station at Weber State University (WSU) is receiving pictures from space on a daily basis. This past week the best picture taken was of the coastline of British Columbia near Vancouver Island. Since Weberware 1.0 has the capability to recover the color in pictures from the imaging data stored in memory, the oceans show up with the proper hues as seen by the camera. Initially it was difficult for the WSU students to pin-point the area snapped by the camera, but checking with QUIKTRAK the time the lens shutter was opened, they determined that it was the coastline of British Columbia. The camera on WO-18 can only take a 170 square mile picture (when looking straight down), so at times one has to be very good at geography. Horizon sensor readings are being integrated into the picture taking software on-board WO-18. The horizon sensors can be interpreted to determine when the satellite is pointing at the earth. The software is being changed so that pictures will only be taken at those times. Hopefully, this will mean the end to pictures of deep space or the sun.

WO-18 may be heard on 437.100 MHz (+/- 10 KHz for doppler shift). The alternate frequency is 437.075 MHz.

WA3PSD is pleased to announce that the beta test version of the picture processing software, Weberware 1.0, will be sent out to a group of carefully choosen software testers next week who will perform intensive checks of the software. If no major bugs are discovered radio amateurs can expect to see Weberware 1.0 available from the AMSAT Software Exchange around the first week of April. WA3PSD wants to emphasis that the first priority at WSU is taking care of WO-18 -- after that, getting the image processing software finished is next. The students at WSU are working as quickly as possible to get this very complicated program into a user friendly state. Weberware 1.0 is designed to run on IBM AT clones equipped with EGA or VGA monitors.

Because of the instant popularity of WSU's efforts in the building the WEBERSAT MICROSAT, many grade school and high school students from the greater Ogden/Salt Lake City area are showing up at the Ground Command Station in the evenings to see what is involved in the care and feeding of an OSCAR satellite. The WSU students have enthusiastically embraced the job of explaining to all who enter the finer details of WO-18 and its many on-board scientific experiments. It is hoped that many of these young people will not only become interested in amateur radio but also start thinking about space.

All radio amateurs are encouraged to continue to save picture data from WO-18 and telemetry. If you would like to receive a beautiful QSL card from WSU, send your QSL card, a copy of WO-18 telementry and a s.a.s.e. to:

Operational Coordinator for Orbital Data Management Appointed

AMSAT-NA V. P. of Operations, Courtney Duncan, N5BF, announces the appointment of Dick Campbell, N3FKV, AMSAT Operational Coordinator for Orbital Data Management. Dick has already assumed his initial responsibility of collecting, reformatting, and releasing keplerian orbital data for satellites of interest to amateur radio operators on a weekly basis.

As AMSAT continues to progess into an era of tracking and utilizing over a dozen satellites (plus weather satellites), Dick will work to improve both our sources for this information, intermediate processing and checking, and our distribution networks to maximize the usefulness of the information for all involved.

Comments and suggestions should be forwarded to:

Dick Campbell, N3FKV
216 Coventry Drive
Lorena, Texas 76655

Dick does not currently live near a packet BBS so packet mail on the subject of AMSAT Orbital Data Management may be forwarded to him via N5BF @ WB6YMH.

ORBIT DATA CHANGES CONSIDERED

HR AMSAT NEWS SERVICE BULLETIN 069.03 FROM AMSAT HQ
SILVER SPRING, MD MARCH 10, 1990
TO ALL RADIO AMATEURS BT

The number of satellites tracked and used by radio amateurs is more than doubling during 1990 and so are the demands on the distribution networks for orbital information. As a result, AMSAT-NA is interested in quantifying its user base and determining their requirements as plans are made to improve the system.

Already, many AMSAT and AMSAT related publications have gone from the familiar "AMSAT Standard" format to the more compact NASA "two line" format to save space. Consideration is also being given to changing to this format for packet radio distribution. For users of PC compatible computer systems with the popular Quiktrak, InstanTrak and Graftrak tracking programs, this poses no problem. These programs are able to make automatic updates of keplerian data from files captured during packet BBS or dial up BBS sessions. Older versions of these programs, programs for other types of computers, and software used in other parts of the world do not have these features, however, and AMSAT is interested in determining exactly what information and formats it should be providing

to its broad user base. Interested users are asked to answer the
following questions and respond to one of the addresses given below.

NAME _____

CALLSIGN _____

ADDRESS _____

What computers, calculators, or other tracking aids do you use for amateur
or weather satellite tracking?

What tracking programs do you use?

What type of orbital data do you use? (AMSAT sets, NASA two-line, equator
crossing time and longitude, other - please describe).

How often do you do orbital data updates?

How do you perform these updates? (Manually, tracking program utility)

How many and which satellites do you maintain in your database? How
many do you routinely use?

Where do you obtain your orbital data? (AMSAT Nets, Packet BBS, printed
publications, mail from NASA, other - please describe).

Please send replies to:

Dick Campbell, N3FKV
AMSAT-NA Operational Coordinator
for Orbital Data Management

SEARCH FOR UO-15 FAILURE MODE CONTINUES

HR AMSAT NEWS SERVICE BULLETIN 069.04 FROM AMSAT HQ
SILVER SPRING, MD MARCH 10, 1990
TO ALL RADIO AMATEURS BT

Volunteers at the Stanford Research Institute (SRI) have been working with the
University of Surrey (UoS) to try to determine what may be preventing UO-15
from downlinking telemetry. Martin Sweeting of the UoS reported that SRI is
making available a 150 foot dish and its sophisticated signal processing
equipment to determine if any of the sub-systems on UO-15 are still
operational. If you will remember, SRI has aided UoS in the past by using the
same dish to uplink a signal of "sufficient strength" to overcome the desensing
of UO-9's command receiver when its two meter transmitter was erroneously
turned on.

The signals SRI are trying to receive are the local oscillators on board UO-15. It has been calculated that the receive signal strength of UO-15's LOs are approximately -160 dBm (talk about small-signal work!). A trial run this week of receiving LO signals from the healthy UO-14 was deemed successful, although it required signal analyzers utilizing FFT techniques that provided a 1 Hz resolution bandwidth over a 5 KHz BW to discern the signals. SRI will now try to locate UO-15's LO signals over the next week and from the results of those efforts, the University of Surrey's engineering team will make a determination if it is possible to "pull the cork" on UO-15's transmitter.

MICROSAT UPDATE

HR AMSAT NEWS SERVICE BULLETIN 069.05 FROM AMSAT HQ
SILVER SPRING, MD MARCH 10, 1990
TO ALL RADIO AMATEURS BT

Week seven at the AMSAT Satellite factory finds each satellite closer to full commissioning for general use. DO-17 continues to excite newcomers to the world of Amateur Satellites with its ease of telemetry reception. Anyone with a 2 meter FM receiver tuned to 146.825 MHz, a 1/4 wave ground plane antenna (there is no tracking required with this antenna!) and a standard TNC will be able to receive telemetry packets from DO-17. By listening from 8:00 am through 1:00 am and 7:00 pm through 12:00 am local time, you should be able to pick up a number of passes of DO-17. DO-17 transmits packets for about 2.5 minutes followed by an "off period" of about 30 seconds. As is the case with each of the Microsats, the telemetry offers 59 telemetry points and the AMSAT Software Exchange has available programs that translate the data points into more easily recognizable information (ie: battery voltage, solar cell current etc.).

AO-16 and LO-19 have been available for digipeating packets. Numerous stations have successfully connected to "DX" (as far as VHF-packet operations is concerned) via these two birds. The Store and Forward capabilities of AO-16 and LO-19 have yet to be enabled, pending further testing.

The modulation protocol on these two birds is as follows. The TNC must use an external 1200 baud PSK modem rather than the FSK modem that is standard on commercial TNCs. Approximately 100 watts EIRP FM is all that is required to access AO-16 or LO-19. Your downlink receiver must be set to USB or LSB. To digipeat through AO-16 you must use the address PACSAT-1. To digipeat through LO-19 you must use the address LUSAT-1. Below are listed the downlink and uplink frequencies of AO-16 and LO-19:

AO-16 Downlink 437.025 437.050 MHz
Uplink 145.90 145.92 145.94 145.96 MHz

LO-19 Downlink 437.150 437.125 MHz
Uplink 145.84 145.86 145.88 145.90 MHz

UOSAT-OSCAR-14 and UOSAT-OSCAR-15 REPORT #007 15-Mar-90

** UoSAT-OSCAR-14 **

Attitude Control and Stabilization

Manueuvers prior to gravity gradient stabilization have taken somewhat longer
than expected. The most recent delays were caused by the need to add digital
filters to the attitude determination software to remove unwanted noise from
the magnetometer readings. The filters have been installed, and a new version
of the FORTH diary will be uploaded soon.

High Speed Downlink Tests

The UoSAT Command Station has been conducting limited experiments with the
9600 bits/second Frequency Shift Keyed (FSK) downlink on UO-14. These tests
have been quite successful, doubling the highest digital link speed previously
used on any OSCAR satellite (4800 bps is routinely used on UO-11).

Data transmitted during these tests has been either asynchronous telemetry
from the Very Large Scale Integrated telemetry system or continuous streams of
1 bits (no data at all). The "stuck ones" tests are very useful because of
the scramblers in the modulator and demodulator. The 1's are scrambled and
transmitted as pseudorandom data over the RF link. The groundstation
demodulators then lock onto this data, descramble it, and reproduce the
continuous 1's. Any 0's in the demodulated output data stream are caused by
bit errors on the communication link, and the link bit error rate (BER) can be
calculated from the frequency of such transitions.

BER tests are to be scheduled into the DIARY in aid of those trying to test their FSK receive systems. The first scheduled tests were scheduled for the morning passes over the East Coast of the US on 15 March.

- de G0/K8KA.

** UoSAT-OSCAR-15 **

The team at Stanford has succeeded in detecting local oscillator (LO) leakage from the UO-15 command receiver. The weak signals were first detected on March 10 and then again on March 11. Roy Long, leading the Stanford Research Institute team on the recovery attempt, said that there is no doubt that the signal comes from UoSAT-15. It is weaker than the corresponding signal on UoSAT-14, as expected from prelaunch measurements.

Each UoSAT carries three receivers: a fixed-frequency command receiver and two communications receivers with switchable frequency. Efforts will now concentrate on monitoring one of the switchable frequency receivers. If one of these receivers is heard, commands will then be sent to change the receiver frequency, which should cause a corresponding change in the LO frequency. Observation of changed LO frequency will confirm that the satellite's command system is basically healthy.

The work at Stanford is very time consuming, requiring azimuth and elevation control of the huge Stanford 150 diameter dish to within tight limits. Data are collected for only a few seconds, followed by hours of post-processing.

DOVE-OSCAR-17's On-board Computer (OBC) Experiences A Crash

On Wednesday March 14, reports were received that an On-Board Computer (OBC) crash had occurred on DOVE-1. Since then, only a continuous carrier with packet "flags" has been heard on the DO-17 downlink of 145.825 MHz. At the present time it has not been determined exactly how this computer anomaly occured. Attempts are being made to perform a reset of the DOVE-1 CPU.

At the present time the MICROSAT Engineering Team does not feel this condition poses any threat to the well-being of DO-17. After several command tests, the anomalous situation will be better understood. If a reset attempt is succesful, the S band transmitter will be commanded on and two meter transmissions will be suspended until after the next software upload is completed. Data reports from S band receiving stations will be crucial during the period following the reset. Stations equipped to receive 1200 bps PSK on 2400.1 - 2400.3 MHz should contact Courtney Duncan, N5BF, or Bruce Rahn, WB9ANQ via the AMSAT-NA Operations Net or AMSAT-NA Headquarters. Also, data reports from shortly before the CPU crash will be appreciated. For information on submitting reports, see the following ANS bulletin

concerning the Microsat Data Archive.

Stay tuned to AMSAT Nets and ANS bulletins for further updates.

MICROSAT DATA ARCHIVE ESTABLISHED

HR AMSAT NEWS SERVICE BULLETIN 076.03 FROM AMSAT HQ
SILVER SPRING, MD MARCH 17, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Vice President for Operations, Courtney Duncan, N5BF, announces the appointment of Reid Bristor, WA4UPD, Technical Coordinator for Satellite Data Archiving.

Reid has set up a database using DEC computers and large, removable fixed disk drive systems and is now ready to begin receiving data for collating and storage. Microsat files collected in either KISS or ASCII mode are acceptable. File naming is not yet standardized so any convention is ok as long as submitters include a note explaining how their personal naming convention works. A standard format for file naming and file contents will be published soon after which all submissions must conform. At this time, all Microsat datafiles are welcome.

This archive will be used to keep records on the Microsat spacecraft over short and long term periods and to allow various spacecraft parameters and trends to be analyzed. Clearly, any such research will benefit from the most complete dataset possible, thus, it is very important that everyone with captured data send copies to Reid for inclusion in the master archive. Command and monitoring station operators are very dedicated individuals but they all have careers, families, and other responsibilities and have not been able to take data for every visibility of every satellite since launch. Also, each satellite is only visible a small percentage of the time from any given location. There is no single, complete collection of Microsat telemetry data; AMSAT is counting on the many amateur satellite users around the world who have been logging data for the last two months to begin this collection. There is a good chance that the data submitted by any individual is unique and therefore very important to the collection. Submissions are solicited from North and South America, Africa, Europe and Asia, Australia and Oceania, and any other locations for all times since the Microsat launch.

As the system developes, it will be expanded to include other amateur satellites besides the Microsats. Submission standards will be published and amateurs wishing access to the data for analysis and research will be accomodated.

Reid is prepared to take submissions by mail in any of the IBM-PC 5.25 or 3.5 inch disk formats, Commodore-64 1541, 1571, and 1581 formats, and DEC RX-50 and RX-01/2 formats (as used on the Rainbow 100 and PRO series DEC systems). Those with disks in Apple, MacIntosh, or any other formats not listed are asked to write to Reid at the address given

below to work out the details of data submission. Files may be compressed using PKARC. Direct, electronic submission of data may be instituted in the future if it is deemed practical.

Data diskettes, inquiries, comments, and other correspondence concerning the Microsat / Amateur Satellite Data Archive may be directed to:

Reid Bristor, WA4UPD @ N4JLR
4535 Deerwood Trail
Melbourne, Florida 32935

Reid also participates regularly in the Amsat-NA Operations Net on AO-13 and can be contacted there.

AO-10 & 13 TRANSPONDER SCHEDULES

HR AMSAT NEWS SERVICE BULLETIN 076.04 FROM AMSAT HQ
SILVER SPRING, MD MARCH 17, 1990
TO ALL RADIO AMATEURS BT

AO-13 Transponder Schedule to 09May90

Mode-B : MA 000 to MA 165
Mode-JL : MA 165 to MA 195
Mode-S : MA 195 to MA 200
Mode-BS : MA 200 to MA 205
Mode-B : MA 205 to MA 256
Omnis : MA 240 to MA 060

BLON = 207.4 and BLAT = 1.7 for 19Mar90

The Mode-B beacon will be ON from MA 195 to MA 200. However from 21Feb90 to 21Mar90 there will be an OFF period from MA 20 to MA 90 due to solar eclipses affecting AO-13. The length of the eclipses vary from 12 to 89 minutes. Only the Mode-S transponder & the Mode-B beacon will be ON from MA 195 to MA 200.

AO-10 is currently experiencing solar eclipses during major portions of it orbit and until further notice its transponder is not available for use.

SA AMSAT BACAR MISSION 90/1 A HUGE SUCCESS

HR AMSAT NEWS SERVICE BULLETIN 076.06 FROM AMSAT HQ
SILVER SPRING, MD MARCH 17, 1990
TO ALL RADIO AMATEURS BT

BACAR mission 90/1 was a huge success. Three balloons carried BACAR (BAlloon Carrying Amateur Radio) to a height of nearly 50,000 feet above sea level in what can be described as a flawless mission.

BACAR was equipped with an RTTY telemetry unit providing information such as current altitude and rate of climb. The telemetry transmitter's output was in the 2 meter band. The camera used was a closed circuit monochrome CCD television camera fitted with an 8.5 mm lens. The camera had an automatic gain control circuit which compensated for the variation in light intensities. The video output from the camera was fed into a video transmitter operating on standard UHF channel 35 (583.250 MHz). The transmitter consisted of a crystal controlled oscillator on 48 MHz which was multiplied up to the output frequency. Modulation was applied to the driver and output stages which then drove a co-linear ground plane antenna. The output of the transmitter was 1.7 watts. BACAR was powered by common alkaline batteries.

With an expensive camera on board, special precautions were taken to ensure that BACAR would be recovered. A special release mechanism was used that automatically released BACAR from the balloons 90 minutes after launch. As a further safety precaution, a telecommand receiver was also built into the device.

The local weather bureau provided tracking support and other logistical assistance. The launch went off like clockwork and seconds after BACAR started to ascend, reports of good quality video were received. Later in the flight video reception was reported from as far as Pietersburg, a city over 300 km from the launch site. Reports and video tapes are still being received.

MAC TLM PROGRAM AVAILABLE

HR AMSAT NEWS SERVICE BULLETIN 083.03 FROM AMSAT HQ
SILVER SPRING, MD MARCH 24, 1990
TO ALL RADIO AMATEURS BT

MACINTOSH MICROSAT Telemetry Decoding Program Now Available

Jim White (WD0E) reports that his TLMDCMac program is now available from the AMSAT Software Exchange. TLMDCMac is a Macintosh application that decodes telemetry (TLM) from any of the four AMSAT MICROSATs (AO-16, DO-17, WO-18, LO-19). It takes the values that are transmitted by the satellites and transforms them into "engineering values" that indicate how the spacecraft is operating, i.e., the RF power output of the transmitters, temperatures, current being generated from the solar arrays, etc. The telemetry data can be viewed live on the Mac screen during a MICROSAT pass by connection from your TNC to one of the Mac serial ports. You can also record the TLM and read it into TLMDCMac later. Recorded files must be in ASCII text (no KISS) and can

be from any source. The program displays the raw TLM data and the decoded values (in Amps, degrees C, etc.) in two separate resizable, movable windows on the Mac screen. Decoded values are displayed in logical groups. It can also, at the user's option, create three separate output files: The raw TLM, the decoded values in a tabular format (probably not available in V1.0), or the decoded values in the SYLK format. The latter can be read into most any spread sheet application for further analysis, charting, etc. Included with the program is a Parameter Converter application for updating the files of parameters used to decode the raw TLM, the parameter files themselves, and a set of EXCEL templates in which data can be pasted into for further analysis. A complete user guide and some sample TLM files are also included. A Mac 512E, Plus, SE, Mac II, or Mac Portable can be used. For further information about the availability of this program, contact the Software Exchange at (301) 589-6062.

DO-17 RECOVERED BY EME STATION

HR AMSAT NEWS SERVICE BULLETIN 083.06 FROM AMSAT HQ
SILVER SPRING, MD MARCH 24, 1990
TO ALL RADIO AMATEURS BT

W5UN's Big EME Station "Gets" DOVE's Attention!

On Saturday, 17-Mar-90 the AMSAT Engineering Team successfully reset the CPU on DO-17 and commanded the 2M transmitter off. Dave Blaschke (W5UN) is the owner of the world's largest privately owned 2 meter antenna and was teamed with Harold Price (NK6K) to overcome the desense problem (DO-17's command receiver is also in the 2M band and the constant "streaming" by the transmitter desensed the command receiver). Even with 32.5 dBi gain, and nearly 2 megawatts of EIRP, it took Dave and Harold several days of transmitting the reset sequence before they were successful.

Alberto Zagni (I2KBD) reported that the transmitter power was dropping significantly at the end of the eclipse portion of the orbit which indicated that the batteries were flattening out. Armed with this information, Bob McGwier (N4HY) strategized with W5UN as to the two best times to reset the spacecraft CPU and turn the transmitter off. The first was at the end of the eclipse period, when transmitter power would be at its lowest point. However, if it turned out that the battery voltage was too low to maintain the GASFET preamp in the receiver, then the next time to try was just as the transmitter power was falling off (soon after it left the sun and started the voltage descent in eclipse). The latter was the time which turned out to be successful.

Almost immediately following the reset, NK6K uploaded a new set of battery charging commands and transmitter state commands. Early the next morning, Bob commanded the S band transmitter on and the two meter transmitter off. Bill McCaa, K0RZ, successfully copied the S band beacon. The AMSAT Engineering Team is reviewing the events of the last week to determine the failure mode. Once they have completed their investigation, they will upload the operating system for DO-17 and continue its shakedown prior to commissioning. DO-17 is not expected to be fully commissioned until sometime in April.

Johnson Space Flight Center to Host 1990 AMSAT Symposium

AMSAT has announced that the 1990 AMSAT Space Symposium will be held at NASA's Johnson Space Center near Houston Texas. The dates for the weekend meeting which will be hosted by the Johnson Space Center Amateur Radio Club, W5RRR, are October 19, 20 and 21.

Registration will open on Friday afternoon at the nearby King's Inn, and tours of the Center will be possible only on Friday and Monday. The tour includes areas such as Mission Control, the Shuttle Mock-up facility as well as the "Zero-G" Tank, a massive swimming pool used to train mission specialists for Shuttle Extra Vehicular Activities (rubber rafts are not allowed and space suits not necessary).

The Symposium will take place on Saturday in the Visitor Center's Main Auditorium. It is sure to be a day packed with talks and presentations on various amateur satellite and related projects. The day will conclude with a Texas-style Bar-B-Que and the AMSAT Banquet.

Many details have still yet to be worked out, but if their schedules allow, Ron Parise (WA4SIR) Mission Specialist on the upcoming STS-35 mission and Ken Cameron (KB5AWP) the Shuttle Pilot on STS-37 will be in attendance. Ken's mission is presently scheduled to be launched approximately two weeks following the annual meeting, so he may have late inside infomration on how he plans to operate during his mission.

Mark your calendar (using a pen) and make plans to attend this year's AMSAT Symposium. This is the "Year of the Amateur Satellite" and if you haven't gotten involved in the Amateur Space program, this would be an excellent way to find out what it is really all about. This is sure to be one of the most exciting Symposiums ever.

MIR Space Station Amateur Radio Operations Expected To Resume

AMSAT has received information from reliable sources that Soviet cosmonauts Anatoly Soloviev (U6MIR) and Alexander Balandin (U7MIR) may have resumed amateur radio activity from MIR, the Soviet Space Station. They are reported to be transmitting in 2 meter band primarily on 145.50 but may also be found on 145.550 MHz. The most probable time of operation is after 18:00 UTC and any time on weekends.

It was reported that the new radio brought up by the new operators has broken down and that Anatoly and Alexander were using the old equipment left by U2MIR

and U4MIR. There are plans to replace the broken rig in the near future, possibly on an unmanned supply mission.

QSLs can be sent via bureau or direct to their QSL manager UW3AX at: P.O.Box 679, MOSCOW 107207, USSR. If you send a card direct, they request an IRC and a self-addressed envelope.

[More deleted]

Maybe I missed something... But this sounds harder than learning
the traditional way (that is, hearing the sound pattern, and then writting
down the character for that sound pattern), and is also a useless skill!
At least CW is useful!

I teach Nervous (oops... Novice) classes, and occasionally get a
few very smart student who tries to beat the system... He usually falls behind
the rest once he realizes that his 'method' causes problems, and he can't copy
the code. Now he (or she) realizes (sp?) that all the time that was spent
studying with this new method could have been spent on learning the code.

What works best for my classes is the following:

Morse (from day one) is sent at a character speed of 18WPM, the spacing is
adjusted to provide for 5WPM (Note that the ARRL has now switched to this
method for the VE exams, and their practice tapes). I explain that one needs
to practice every day, and if one has the time, two to three 10-15 minute
sessions will do.

Those who follow this schedule can pass the Novice/Tech 5WPM exam in about
4 weeks... Those who can't devote this much time (some of us have jobs/family,
etc) take longer.

If you want to learn CW (Morse code), then spend a little time, you only need
to give it a chance.

By the way... the most important point that most people don't realize:

When you are trying to learn Morse code to pass an exam, you MUST write
each character as you hear it. Listening to a tape (or radio, computer, etc)
while you are doing something else won't hurt... but it DOES NOT SUBSTITUTE for
written practice. Many think they can listen to tapes while driving to/from
work. They get a surprize when they sit down for a written exam. They must

convert each character in their head, and then from their head to the fingers
to write the character.

If you can, you want the CW to go into you ears, and directly to your fingers
without passing through your brain, this is easier for some than others :-)!

I hope this helps.... It just takes a little practice, and it IS worth it!

(By the way.... I am FOR the no cw test required Amateur Radio operator
license class..... We need to INCLUDE people, not exclude them!)

Rich (NM1D)

I'll throw my few cents in. I own a MFJ tunner, one of the 949 series,
and an antenna bridge. They both work fine and do the job required.
I would say that the value is there for what I paid. The antenna
tunner certainly does not compare to a Nye-Johnson tunner or a Ten-Ten
tunner, but hey for the money it does the job fine and has an acceptable
quality level. Same goes for the antenna bridge. I have tunned up
several antennas with it without a problem and for the amount of use I
give it I can not complain about the performance. This V31BB character
apparently did not talk to MFJ. If he has a complaint about the product he
should at least give the manufacturer a chance to respond instead of taking
his complaints public. As I recall, several months ago a person on
this net was complaining about a speaker/mike. About a week later he
posted an apology, seemed MFJ found out about his problem and sent him
a new speaker/mike no questions asked. I would buy a MFJ product again
with out hesitation. They provide a good product at an affordable price.

I am considering renewing or starting subscriptions to various HAM magazines,
and would appreciate comments or suggestions.

My priority list goes something like this:

1) Technical content
2) Technical content
3) Technical content
4) Operating practice, band openings, etc
...
98) Contests
99) Silent Keys (unless I am listed; that would concern me :-(

QST, Ham Radio, and 73 Magazine are locally available, so I have a pretty
good idea of their content... how about QEX or others I may not be aware
of? Any good newsletters?

How about it, fellow hams?

... de wb6cxc <end of work>

Or perhaps as a modulated signal source for a Transverter.

Or perhaps in the case of UHF, to cover the 420-440 Mhz part of the band
the Japanese forgot we even have (and they have 430-440 themselves).

Also I understand the IC-2SAT can receive on most of 902-928 Mhz, making
it possibly useful as a cross band transsceiver if someone were inclined
to make a repeater with 2m input and 33cm output.

> Aurora can only be effectively utilized if CW is used.
>
> During contests, I can do a CW contact in about 1/2 the time a voice
> contact takes, and I never have to ask for a repeat.

OK, then we will not allow Communicators the privilege of working Aurora
or contests. How's that?

I'd far sooner ban contests than ban CW. I am not proposing either, but
would like to see contests restricted to a subband.

Really, most of the people who are sitting out of ham radio because of
our stinking attitudes don't give a whit about HF and shortwave and
working Bouvet Island. But you guys see those desires as not consistent
with being a ham and don't want them, nor their "techno-nerd" attitudes
that just might save ham radio so the rest of us who do want to work
CW and such can continue to do so through the next century or so, on
frequencies we legally have allocated.

> Once, about 10 years ago, I copied a distress call from someone who went
> down in an airplane, near Mansfield, OH. Since the signal was CW in a

> very quickly. I was able to help out these people by calling the local
> FAA and giving them the details. A signal in any other mode would not
> have attracted my attention (or anybody else's) like it did. (Note: it
> was a very weak signal, and I doubt that it would have been copyable if
> it wasn't CW.

So what?

I'd sure like to know why this guy was on a "phone band" (and I guess
you mean HF, you probably don't know there is a VHF :-) instead of one
of the standard distress frequencies (500 khz, 2182 khz, 3023 khz, 5680 khz,
8364 khz, 121.5 Mhz, 243 Mhz, etc.). Sure if his aeronautical comm gear
went out at the time and he HAPPENED to have a ham rig that survived with
power, OR better yet, BUILT AN EMEREGENCY RADIO that he could key on and
off with wire contacts, then I can see why he'd be there.

1: these things are rare and getting rarer.

2: the number of hams who do know CW are not going to drastically get
smaller as a result of the no-code license. Those who want to forget
code do so now. Those who want to never learn it also do so now.

>I would like to know if Spring and Summer has any effect on reception.

I've found that in my experience, at least, it does -- in particular my winter reception of stations around 8-10 MHz is much better than in the summer. All winter I have been able to receive several US WEFAX stations very well which are now beginning to deteriorate in quality; if last summer was typical, it will stay that way all summer. I am guessing this has to do with the amount of time the upper atmosphere is exposed to solar radiation during the day, and/or the incident angle of the radiation being greater in the summer. But I don't know for sure.

>Our Earth Science Department purchased a Kenwood R-2000 HF receiver and an AldenElectronics
>9321 Weather Chart Recorder for reception of radio fax weather
>pictures.

Well, you have purchased a very wonderful piece of equipment. Clean all the mess off of it (I'm assuming you bought one of the FAA surplus models?), buy the maintenance manual for it, and look carefully at how it is constructed. This is how electronic things are built when maximizing profit through minimizing the production costs is not the primary goal. I think you could mount it on a truck and drive around with it running and it would still record. Well, probably not really, the loop electrode assembly would bounce around. It is really easy to maintain, too, and its principles of operation are both easy to understand, and somewhat amazing -- it's the first place I ever encountered a "sample and hold" circuit... since it is built in discrete components rather than on an IC, you can see how it works. It's fairly amazing the way it captures the voltage at the peaks of the AM carrier cycles on a small capacitor between two MOS FETs. The only problem is moving it... when I moved to a new location awhile back, the mover threatened to quit when they saw the equipment because they didn't want to carry it down the stairs, it's so heavy.

If you're buying the replacement parts (you have to replace the loop and blade electrodes regularly, plus other parts that occasionally wear out, and also buy the wet electrolytic paper for it) from someone other than Alden, write to the address that's on the chassis and ask for pricing information. You might ask for the original advertising information on the recorder, too... it's interesting how expensive the optional parts are, new. I'm not sure how much the recorders sell for, new, but Alden still sells them.

>Nonetheless we have never seen anything printed in the fax machine except
>black lines.

Yes, it only has an AM demodulator in there unless you have a special model. I posted detailed design information for an FM demodulator *specifically* for the Alden 9231 about a year ago, which you need to demodulate the FM subcarrier that is transmitted on HF. You can receive pictures from the polar satellites, and from the GOES Tap if your have that, directly with the 9231, though, since that's what its demodulator is for. One problem is that the 9231 emits RF interference fairly strongly on 137.4 and 137.62 MHz, as well as random noise from the

switching of the marking amp on and off. I wish it didn't since those are prime polar satellite frequencies, but I guess it passes the FCC emissions regulations, and it was actually made for use with leased wire services. I've never been able to figure out what causes the interference, but it comes from the master oscillator board, which runs at a much lower frequency. If you figure out how to reduce the RFI I'd be interested. One problem I found is that the signal input line goes directly past the power supply line to the marking amp (it's wrapped inside the same bundle of wires), which inductively picks up noise from the marking amplifier transistor turning on and off.

> -- Is there a better way to receive weather pictures with different
> gear? Is there a TNC and PC setup that might work better than
> the paper based fax unit?

Yes. The best I've found is the A&A Engineering demodulator using a PC with a VGA, about $120 or so. There are commercial programs such as the Elmer Schwittek MultiFax software package you can use to display output from the A&A demodulator on the PC. These give photographic quality images, compared to the good but limited-contrast and limited-resolution images of the 9231. The 9231 is best for recording weather maps rather than satellite pictures.

> -- What should the receiver bet set on? (AM, USB, LSB, CW)

For HF stations, set it on USB or LSB -- if you set it to the wrong sideband you will get a negative image and will know you need to use the other (also the recorder won't sync properly if you're using the wrong sideband).

For direct reception from the polar satellites, use FM, but you need a WEFAX receiver for that. Despite what people say, other kinds of receivers won't work very well... I've tried it. You get a picture but with a lot of noise and poor grey scale. The WEFAX receivers are relatively inexpensive compared to general-coverage receivers and scanners.

> -- Is a long wire good enough or do we need a beam or something?

Yes, a long wire is fine for HF. For VHF from the satellite, you need a circularly-polarized antenna such as the WEFAXTENNA from Vanguard.

>Any assistance or help would be greatly appreciated. Earth Science won't
>let me walk down their hall until I get this thing working.

I hope the above will be of some help.

1881. The Belize Bum (V31BB)

Newsgroup: rec.ham-radio
Date: 1990-03-26 21:41:00 UTC
From: CSMSCST@OAC.UCLA.EDU
Message-ID: <9003270810.AA13572@ucbvax.Berkeley.EDU>
Source record: 12430

Noted in the latest W6GO QSL list:
V31BB - V31BB says he DOES NOT QSL; save your money

Heard during the WPX 'test last weekend:
V31BB - "Don't send me your stupid card. I don't want your
card. I don't want your stupid IRC's. I don't
want your money."

(However, he has never been known to return either IRCs or money.)

I can understand a DX station that is tired of the bother
and cost of QSLing, and just wants to work contests, or QSO.
But I have trouble figuring out why a station who has a
stated NO QSL policy frequently runs DXpedition-style ops
and builds pileups (You're 59. Next.) Why does he think
those stations want to work him...

Also heard from BB during the 'test: A very new ham with a
novice call called him, and instead of of just giving him a
quick 59 #nnn, added "You'er my first DX contact. I'm only
running a dipole and am thrilled you heard me." BB proceeded
to rake him over the coals for at least three minutes, for
wasting him (BB's) time with meaningless information, etc.
etc.

IMHO, this guy gets the Jerk of the Year award. His problem
is he is on a power trip. He gets his kicks from hearing
people scremaing for him in pileups and begging for QSLs.
Please don't add to his ego - next time you heard him on,
work someone else.

Also heard: Some DX club has built a rent-a-QTH in Belize,
so it should become real common. Wait and get your QSL from
a real ham.

> be interested in doing. Some people don't like being told that they have
> to learn something they know they are not going to use and will do them no
> good.
SOME people have a severe lack of discipline....
I want to be an EE, so why should I waste time taking all this
English Lit and History?? Does that mean I have an attitude problem??
If we apply the no-code argument to this analogy, you will see what
I mean by lowering the standards being dangerous.

> Further, because hams have (and certainly at least in the past this has
> been MOST hams) wanted everyone to pass a code test to "get in", the
> "outsiders" who were interested in other things looked upon the hams, and
> the amateur radio service itself, as having an "attitude problem".
*** BLATANT GENERALIZATION ALERT *** Your opinion of what MOST hams
wanted is no more factual than the perceived view of code being the
big "boogie-man" to people getting into ham-radio. I never EVER heard
any ham say anything to the effect of using morse code as a "hazing"
or passing of rights. I have only heard this from 'outsiders' that
feel victimized for some reason. The only reason I ever wanted someone
to pass a code test was because it was required by law and I wished to
see them enjoy the same hobby I have enjoyed. Who in the heck ever
started the "good-ole-boys" or "Ham-fraternity" thing anyway. The
only thing an 'outsider' ever needed to do was ask a Ham how to get
started. It has been that simple for decades, and has been done
a million times.

> Probably everyone has an attitude "problem", but some of us are just not
> making much of an effort to get along with those who have a DIFFERENT
> attitude problem.
The only attitude I have a problem with is the one that thinks code
is "The big barrier" to ham-radio that "discriminates" against us.
> > BTW, I am not an objector to a no-code intro level licence, there is a
> > VHF only n0-code going into effect here next September and I think it

It'll fit on the computer.....what a justification for a license
system with today's technology :-|
> --Phil Howard, KA9WGN--
> <phil@ux1.cso.uiuc.edu>

In spite of my better judgement I have gotten caught up in this long
winded issue. On this note I will drop into the QRM and shut up.
I have no particular reason to oppose the no-code class, but this
bad feeling keeps nagging me. It is not that I want to keep all the
spectrum to myself and lock out the "fraternity", but wish to preserve
what is good and courteous (whats left) about my hobby. Ham radio has
been in my family since 1934 so alot of my "attitude" comes from the
way I was brought up and the old-fashioned ways of radio my grandfather
taught me. Old habits are hard to break, and old values are hard to
give up. It is time
to drop this whole thing cuz TIME will eventually prove one side right
or wrong. Unfortunately, if it was wrong, it will be impossible to
undo. Perhaps this is why the whole thing makes me nervous.

PRAYING THAT MY DOUBTS ARE UNFOUNDED..... es gratious big welcomes
to the new guys when they get here. The only thing to do now is be
a good example for the new ranks and enjoy the new contacts.

de km4jn :-) love them sun spots....

Source record: 12435

Here's one for the VE's: I have become acquainted with a physically handi-
capped individual who fairly recently obtained a Tech license (N5PSX). His
handicap is so severe that he is confined to a wheelchair, can't speak plainly,
and his hands are so knarled that he can't hold a pencil (or even "unbend" his
wrists). He uses a computer to send various phrases, but can, by a slow and
laborious process, punch in characters key-by-key- or on regular "brass". He
can copy 5 to 6 WPM by the "hunt-and-peck" method on a keyboard.

Problem is, he is technically and operationally capable of passing the General
and could pass the CW portion if he could copy down the characters fast enough.
"Head copy" is ruled out because few people can copy and remember a five-minute
conversation in their heads. I would like to know if anyone has had any
similar situation and if there is a provision whereby the 13WPM cam be waived
due to such a physical handicap. Please post your responses so others who may
have had (or may encounter) this situation will know how to proceed. Flame me
directly if you must, not via the bb.

Thanks in advance,
Dube Todd, N5PDK

>certain to be approved. Let us therefore limit our arguing to the more
>constructive issues of how best to implement no-code. Pax?

Yes, we certainly appear to have no-code rammed down our collective throats. That does not mean that we should give up the fight, though. I intend to fight it with every byte of my hard disks and every pin in my printhead.

Yes, I agree that nobody is going to change anyone else's mind among the hard-core - which includes 95% of everyone who's posted a message on the group. The FCC's mind may be made up as well, just as it was on the 220 rape. If nothing else, though, I hope they'll get enough comments to know they've been in a fight.

To the guy who suggested a rec.ham-radio.debate group: it was suggested before, and that generated the HAMLICEN mailing list. It was taken over almost completely by the anti-code types, and while I continue to read it, I won't contribute to it - I can't afford to replaced a modem that's been flamed to a crisp.

^^^^^^^^^^^^^^^^^^^^^^ aaaaaarrrrrrrrrrrgggggggggg!!!!!!!!
Ken has indeed given three instances where cw is very useful. I didn't
ask for instances where cw is useful. I ask for an explanation of the
usefulness of the cw *REQUIREMENT*. I will counter with the argument that
packet radio allows much more rapid dissemination of bulletins, therefore
every ham should be required to understand how to decode AX.25 headers.
RTTY contacts can be collected for a special endorsement on a WAS certificate,
therefore every ham should be required to regurgitate the BAUDOT code.
I could go on.

> .... I could go on, but I don't think you want
> me to.

Yes I do want you to go on. I am very open to being convinced that all
of the sweating I did to pass that stupid code test was useful. No one
has convinced me yet.

I will never argue that code isn't useful. I would never try to get rid
of code from the bands. I am saying that the code requirement keeps
qualified people OUT of ham radio without keeping LIDS out. If ham radio
was growing and staying on the leading edge of technology I probably
wouldn't be nearly so venomous. As it is, the code requirement for
a reasonable vhf and up license is no wiser than handling radium just
because Ms. Curie did the same.

I didn't like broccoli when I was 5 years old. I didn't even like it when
I was 15, but I DID NOT STARVE OR GO HUNGRY. Now I like broccoli.

It is human nature to not like something someone pushes you into.
But once you get to just see it for what it is, you might very well
find you do like it.

What code is NOT is the ideal communications emission.
What code *IS* is a lot of fun for a lot of people who CHOOSE to use it.

Let there be CHOICE and not force.

I bought an Azden 2m HT (no model number but I believe they only made one model) at a hamfest and haven't yet figured out what all the buttons do. The person I bought it from told me he was going to snail-mail me an instruction book but evidently forgot about it (and I've forgotten his name). Does anyone have one they can xerox and send me? I will happily pay for postage, copying, and nuisance. Send e-mail and we can make arrangements. Thanks!

>confirm this?

To answer my own question:
I managed to catch WWVH one morning and can report that they carry the
GPS message at 43 minutes past the hour with a repeat at 44 minutes
past. This is followed at 45 minutes past with the solar activity /
geomagnetic field report, at 47 minutes past with the Omega navigation
system status report, and at 48 minutes through to 51 minutes past with
Pacific Ocean weather.

1894. Slow scan TV via the new Visitel Telephone devices

Newsgroup: rec.ham-radio
Date: 1990-03-27 03:15:48 UTC
From: johnk@gvgpsa.GVG.TEK.COM
Message-ID: <1423@gvgpsa.GVG.TEK.COM>
Source record: 12443

I bought a Visitel picture telephone a couple of months ago to stay
in visual contact with relatives. The thought occurred to me that
it could also be the "poor man's" method of slow scan TV on ham.

Questions:

* has anyone tried it?
* any complications?
* is it compatible with any mode of existing "regular" slow scan TV/ham
equipment?

For those not familiar, Mitsubishi, Sony and Panasonic are now selling
video phones which are equipped with a small camera and b/w monitor
that just plug into a modular jack and allow you to send stills
down a regular phone line. You look into the camera, see yourself
on the monitor, push a "freeze" button when you like what you see,
and then transmit the still shot down the phone line to another
compatible phone by pressing a "send" button.

It transmits audio tones. Transmission time is about 5 seconds.
You can't talk while the picture is being transmitted.

Fortunately, all three vendors have compatible transmission formats.

I've been trying to find someone else with a Visitel on the air on the
10 meter slow-scan net which meets Sundays from about 11AM-6PM Pacific
time on 28.680. Attempts to send a Visitel picture to other hams with
"regular" slow scan systems have failed; the equipment used by those
particular hams wasn't compatible, unfortunately.

Any comments? If you're interested, see you (hopefully "see" literally)
on 28.680 one of these Sunday afternoons.....

In case you hadn't noticed, the time setting for HfRO was "just after Gorby
took power". Things have changed since then. Besides, ANYTHING is possible
in fiction. Ask Tom Clancey if HE can copy code.

> After seeing the movie, I wondered if there is some standard international
> type of "Q" signals that all submarine forces know...so they can
> communicate across language barriers just like in the movies. Anyone
> know?

I'm sure there are. And aside from the editing, I'm sure they used them.

Now that we have settled on shifting the code test over from ham radio to
submarine officer qualifications, maybe we can go on to more interesting
postings.

> 40-45mA to approximately 60 mA?

An alternative is to increase the charging time. Sorry I can't make any specific part suggestions since I don't the details on the pack. I assume you will only be slow charging it. Given a 33% increase in capacity, at least a 33% charge time increase is called for (now 20 hours instead of 15) but how often to do you actually commit to charging the pack from dead in 15 hours and need it in less than, say, 24 hours?

The League accepts for advertising, basically any company that it deems legitimate in its offering to the amateur market- that means, the company delivers what it says when it says for the price it says. This doesn't mean that the quality is superior to anything else it might be compared to, only that the representation of the product is accurate, per the advertisement. It appears that V31BB has a gripe with MFJ that either he could not resolve amicably with the folks there, or he didn't live up to his end of the warranty responsibilty, or he's just an ass (I suspect a combination of the above).

I used to work for Texas Towers as Sales/Service Manager, and we sold a lot of MFJ stuff. By and large, the quality was o.k., not Cadillac, but a reasonable buy. I would say the number of complaints about their stuff were no more or no less than any of the other brands we sold, including the Big Three. I will admit, however, that most of the complaints about MFJ stuff were towards the power-handling capabilities of their low-priced tuners. I never recommended the 300 Watt tuners where the Tx output exceeded 100 Watts, for that reason- the switches are a little cheesy. But, saying that, I also have to say that a lot of hams have no idea how to use a tuner- a large percentage of those returning tuners for repair/replacement admitted to adjusting the tuner with full power applied, a practice that is not recommended by ANY of the tuner mfrs. I have owned many pieces of MFJ equipment and have always been satisfied.

BTW, MFJ has a good warranty policy and generally won't give you any hassle about repairs or replacement, IF YOU OBEY THE RULES of their warranty statement.

'Nuff said, I'm off MY soapbox.

(Cut to scene of KD5RO/2 wildly waving his arms in the air to get your attention)

I'm active on ALL BANDS, from 1.8 MHz through 10.5 GHz, including 3456 and 5760. I was a part of the group which completed the first EME (moonbounce) QSO's on 3 and 5 Gig. I have both WBFM and NB (SSB/CW) equipment on 10 GHz, running 10 Watts out SSB/CW. There is quite a group of hams here in the Western New York area coming up on these bands- about five or six in our local club, others in the Buffalo and Toronto areas. Down in Pack-Rat Country (Philly) there are probably two dozen guys with stuff on these bands. Up in New England, there are several. The North Texas Microwave Society is a group devoted to these bands and have quite a group on the air up through 10 GHz. Same in the Denver area with the Front Range Microwave Society.

In large measure, the recent increase in activity on the bands above 1296 can be attributed to the work of guys like KK7B and WA8NLC with their designs of no-tune transverters for these bands, and the marketing skills and guts of W3HQT/1 (Down East Microwave), who sells these (and lots of other microwave oriented) products.

Hope this starts to answer your question- BTW, if you're interested in this stuff and want ideas on getting started, email me.

73 Dave KD5RO/2

Oh yeah, I almost forgot- 24 and 47 GHz are still a while away for me, there will be no one else to talk to locally and equipment is rather scarce (surplus at reasonable prices, anyway).

Heard in the WPX contest last weekend:

V31BB: How's my signal up there?
W#%%%: You're louder than KP2A.
V31BB: Really? Put a note on your QSL card about this and I'll buy you
a beer at the Stoffeurs [sp?] in Dayton.

>But I have trouble figuring out why a station who has a
>stated NO QSL policy frequently runs DXpedition-style ops
>and builds pileups (You're 59. Next.) Why does he think
>those stations want to work him...

Because he counts as a multiplier in the contest, and that's what we contesters want. Because sometimes it's a thrill to crack a pileup, no matter who's on the end of it. Because he's not the only V3 on the air (I worked V32SW this weekend, if you really need Belize). If you want QSLs, work JA stations.

>IMHO, this guy gets the Jerk of the Year award. His problem
>is he is on a power trip. He gets his kicks from hearing
>people screaming for him in pileups and begging for QSLs.
>Please don't add to his ego - next time you heard him on,
>work someone else.

And you add to the fever by writing this stuff. Now everyone wants to work Jim to see if he's really as bad as all the netters portray him to be. You're his publicity.

I'm not an advocate of the guy, but I'm not a detractor either. I've never had any trouble working him in any pileup, and frankly every time I've heard him he's been quite entertaining. What more could you want? :-)

I promised myself not to get involved in this discussion, but what the
hey.

As I said in an unrelated previous posting about DX stations in general,
V31BB is just a guy with a radio, the same as every other guy on the band.
No better. No worse. Yet he seems to get people stirred up just as a
guy who was on the bands a few years ago: Mike, WA4D, aka "The Dawg."

I don't see V31BB as being much different from those "phone in and be
abused" type talk-radio shows where the DJ sits around and harangues
the callers. The funny thing is that people sit around and listen
to this stuff for hours and let themselves get all steamed.

Why do people let themselves do this?? The answer must be that they
enjoy letting themselves get angry!

The following analogy is not for those individuals who are getting angry
for the thrill or the "rush" or the high of "letting yourself go" by
becoming enraged. It is for those people who are really upset and
find themselves taking this stuff personally: I don't mean to suggest
V31BB is a raving lunatic, but ... If you met a raving lunatic out
on the street (for instance, a religious zealot who is shouting at
everybody who walks by, telling them they will burn in hell), would
you A) attempt to shout the madman down, or B) Run away! Run away!
If you answer B (like me), then why are you so distressed by V31BB?

The good news is that most of the people on the street are pretty
much minding their own business, just like most of the people on the
ham bands.

> Duane Mantick
> WB9OMC, a "25 watts on 10-meters" insect (according to V31BB, anyway)

Of course it's hard to determine inflection and so forth from written
text, but the insect thing is really pretty funny. Lots of humor
is based on absurdity. I'm 99.9% percent sure that Duane Mantick
put this in his signature because he thinks it is funny, not because
he considers it an evaluation of his worth as a human being.

I have seen references to an FM Citizen's Band radio service refered to as the GMRS or maybe the GRMS service. This seems not to be the 11 meter Citizen's Band Radio Service, as that is limited to AM and SSB.

I don't think this is a part 15 type service either, can anyone shed any light on what it is I keep seeing references to?

1909. Wild accusations against MFJ, V31BB.

Newsgroup: rec.ham-radio
Date: 1990-03-27 19:44:43 UTC
From: waco@cbnewse.ATT.COM
Message-ID: <13855@cbnewse.ATT.COM>
Source record: 12461

In regard to all the postings about MFJ and V31BB, here is my 2 cents worth. I have only two MFJ products: 1) MFJ-102 digital clock 2) MFJ-815B SWR bridge/wattmeter. I have had the clock many years and it keeps exceptionally good time to within a second or so a month. The wattmeter was purchased this January at a local hamfest. After reading all the articles about MFJ quality, I looked inside the unit. It is rather well put together and all the solder joints look OK, not too sloppy. It is neat and looks like they do have some quality control. Also, their guarantee is for one full year; not bad on the average. It works well so far -- I run barefoot.

As to V31BB, he must, indeed, have been contacted by the government agency in Belize regarding his diatribes against MFJ. I last listened to him about three weeks ago and he was ranting on about being told he could no longer mention "the company's name" on the air. He did not do so and I was curious about which company and what he was talking about. After reading the news net here I found out.

As to his being a jerk, he certainly is! The best advice was offered here today, I think, or yesterday. That is to just ignore him. He is not the only ham in Belize and people like him give the hobby a bad name. Without anyone to listen to him I am sure he will eventually go away. People like him feed on reaction and attention. However, if anyone wants to volunteer to engage him in a rag chew during a rare DXpedition, go ahead. That will make sure he does not become a "policeman" on the DX station's frequency -- he seems to be a good candidate for the job.

Remember, DXing is fun, but missing a rare one will not REALLY change your life. There are enough, the vast majority, of good hams to still make this the best hobby there is! One contact with a really nice person makes up for a lot of V31BBs. My contact with JY1 made up for all the jerks I have every run across, almost.

Source record: 12464

>I used to work for Texas Towers as Sales/Service Manager,

Great! Someone who can answer questions that I've wondered about for years! Texas Towers is the firm that has the centerspread ads in CQ every month, right? (If not, ooops, my apologies, insert foot in mouth and hop away... :-) But, assuming I'm remembering right and it is...

1) Why does this company have different reader-service numbers for different pages of its multi-page ad?

2) Why does it have reader-service numbers at all? I've circled numbers on those ads on the CQ bingo card on and off many times over the years, and I have *never* gotten a single piece of literature or a flyer or a catalog from that company. If there is a management decision to not respond to reader-service inquiries, why don't they use the "send all inquiries directly" option CQ offers instead of having numbers?

I've tried various techniques -- picking the number from one page and circling that some months and other months circling all the numbers from all pages. Ignoring the ad for months and then circling the number. Circling all numbers every month for several months in a row. No style ever seems to trigger the company into sending anything out. In recent months I tend to just ignore the ad after this history...

In addition to answering the above specific queries, any comments you care to offer on reader-service inquiries from the vendor side will be appreciated.

I'd like to set up a 10 meter 5W beacon.
I have a couple of questions regarding 10m beacon operation:

1) Is there a currently-available/easy-to-modify-to-10 meters CB tranceiver
on the market? Or other such quick-and-simple xmitter?

2) How do I register the beacon to make it official on the beacon roster?

3) What do hams typically use for the ID'er? I've heard some long-winded
ID'ers out there on some of the beacons.

Any beacon jocks out there?

Thanks,

Charlie Thompson

[followups to news.groups. crossposted to s.e r.h-r for technical reasons,
r.r.s because of satelite discussions]

Since there has been no further discussion, I think it is not
sacreligious to bump up the vote.

CHARTER: REC.ARTS.TV.CABLE

This group is for discussions pertaining in general to cable television,
and satelite television. Broadcast only issues should go to rec.arts.tv.
More specifically, discussions of technical, regulatory, programming,
and/or customer service/cost/quality issues are welcome.

Technical discussions of cable programming technology are welcome, which
is somewhat at odds to its placement in "rec," but this is proposed
simply because of the infeasability of placing the group elsewhere.
The original name rec.arts.tv.catv was objected to by several
because of the confusion over the designation "catv" meaning
community access TV instead of community antenna TV. Several have
objected to placing the group in rec.arts, but there have been no
alternative suggestions.

The newsgroups line would read:

rec.arts.tv.cable Discussion about cable and satelite television

This newsgroup would not be moderated. It distribution would be
world-wide.

To vote, send mail to:

uop.edu!quack!vote-no for no votes
uop.edu!quack!vote-yes for yes votes

A daemon will pick out the "From:" line and add it to a file. No reply
will be sent. Second call with vote list will be posted Tuesday the
2nd, and third call with vote list will be posted Tuesday the 9th.

The vote will end April 16, 2359 UTC, with the usual 5 day wait for
late mail.

Any personal mail may be sent to ...quack!mrapple, but votes sent there
will not be counted. Posted votes will not be counted.

For several reasons, not the least of which the ARPA gateway here has been not been operating here, I have not had the pleasure of reading Info-Hams for at least 6 months.
I was totally amazed to find that just like the soap operas I hadn't missed a thing. Only the names have changed (presumaably to protect the innocent) Rather cunning name changes have been made "code-nocode" has been changed to "increasing CW speed"....subtle Huh
Although I did notice that in several notes some people forgot the name change and still called it "code-nocode".... got to to watch those name changes.....
I see we are still modifying HT's for out of band listening, and transmitting into dummy loads etc. and even still getting into trouble on airplanes with them.
What's the new name of the 220 MHZ discussion or did it dry up.....

If it sounds like I'm cynical it's probably because I am, it's just that it's getting tougher to sort out the real gems and useful information from all the chaff (I'm being polite here) that's flowing downhill.

Cheers and 73's Geoff Williams G4JJO

>
> tnx es 73 de km4jn

Ethically speaking, I personally don't see anything wrong with it...

but...

as I interpret the rules, you would be bringing up the transmitter back at home from your car. That constitutes REMOTE CONTROL. All transmitters under remote control must be controlled by means of either "wire line" (i.e. a phone line, etc.) or by means of a station in AUXILIARY OPERATION. The legal CONTROL POINT would be at the car. That's where you would be able to shutdown the transmitter from should you discover it to be in violation of the rules. My guess is that the FCC wants this communications to be reliable and so requires that all auxiliary operation be limited to frequencies above 220.5 Mhz except 431-433 and 435-438 Mhz. These might change when the 220-222 loss finally happens.

So as long as the transmission from the car to the house is on an auxiliary frequency, then it could be ok, legally.

REMOTE CONTROL of a station is authorized for REPEATERS and I think BEACON stations (I have to double check on beacons, but they don't apply here anyway). A plain patch is just an ordinary station conducting third party traffic (don't forget about the third party traffic rules).

You might be able to turn it into a true repeater. You'd have to make sure that BOTH the input and output are in the repeater subbands of the respective bands. It would have to qualify as a repeater under the repeater rules. Then it can be operating under AUTOMATIC CONTROL and the phone patch can be attached as a extra feature.

Message-ID: <30500481@ux1.cso.uiuc.edu>
Source record: 12474

How about a survey that breaks up the favorite modes in terms of bands?

1. What is your favorite mode(s) on HF
2. What is your favorite mode(s) on VHF
3. What is your favorite mode(s) on UHF

Since the no-code license is only addressing privileges above somewhere
between 30 Mhz and 220 Mhz (depending on which one you look at) I would
think the VHF and UHF distribution to be far more important relative
to having no code requirement on a class giving only those privileges.

How about?

One of the intents of Amateur Radio is to "foster international goodwill".
On the bands, one does not expect to be yelled at or insulted. V31BB
is in a postion, living in an exotic location, of having lots
of stations that would like to work him. He compounds the situation by
working contest-style pileups -- people dying for a Belize QSL. Most of
his victims think they are talking to Joe DX station -- and then they
get slapped. This is enough to get most people steamed.

With a talk show, you know what you're getting into, and you're basically
paying to get abused. With a pileup, you should be able to at least get some
courtesy -- its in the charter of Amateur Radio. Amateur Radio is having
a tough enough time with image as it is - without V31BB.

Don Ahn, AA6UD

1926. V31BB

Newsgroup: rec.ham-radio
Date: 1990-03-28 08:22:28 UTC
From: mgb@TECNET1.JCTE.JCS.MIL
Message-ID: <9003280822.AA16081@tecnet1.jcte.jcs.mil>
Source record: 12477

Has anyone thought about collecting all the articles written on this gentleman via this network and sending them all at once?

I suppose that the infamous recognition might fan the flames of this individual, but it is a pleasant thought.

Heck... he might even send you a QSL! (Joke please... not serious)

Which brings up the topic of "self-policing", something that seems to be on the mind of a lot of people now-a-days. Obviously that term is a joke. The proof of that is in what is happening on our bands today.

Maybe I am daydreaming, but it seems to me that the MAJORITY of hams are disturbed or down-right disgusted at a lot of the behaviour that is going on in our spectrum. The ARRL says that a ham must NEVER jam someone intentionally (so does the FCC), and if you want to get down to brass tacks.... putting a pin in a licensed hams coax is a felony, as is beating the tar out of him at a local hamfest. So I am getting a little short on patience when I read people like Wayne Green saying that WE as HAMS are FAILING at our jobs of "self-policing" because we are too "whimpy". I hear all the accusations, but I sure don't see any valid suggestions on how to stop it.

Mr. Green has a strong medium that he could use to help stop this by simply having a "Lid of the Month" award. We could have write in votes and he could publish the results! But of course he would then probably get SUED, and he is too "whimpy" to risk that!

No... I do not like being called a "whimp". I also don't like people that print up great suggestions for where we as a Amateur Service should be headed, but don't give too many details on how to get there. Sure, you first have to define a GOAL, but I think we're all aware of some pretty good ones to shoot for... it's in how to GET there that really poses the problem.

IMHO the conduct of ham radio operators, and improving same.... is a lot more important... or at least AS important as a code/no-code license.

"Self-Policing"...In ham radio that is a GUN that has NO ammunition, unless you are willing to break the law or compromise your own ethics to make an impact.

I am interested in anyones opinion on this. My personal feeling is that the war on the crazy people has to get personal. Names have to be named and callsigns included. The really worst offenders have to be put on a hit list of every ham so that whenever they hear the persons callsign, they will know that THIS guy is a real turkey. Yes, this could drive

such mentalities into rash behaviour such as jamming the local 2 meter repeater.... but then it is HIM that is breaking the law, and then HE is the one that can be prosecuted.

V31BB has been put on MY hit list, and while the internet probably isn't a good place to keep such a database :-) it is a good example of what I am talking about.

Since CW is not a "good filter" for nut cases, how about filling me in on how to go about stopping this mess? I believe that it is getting worse. Quickly.

Whew... this was pretty strong....I can feel the heat already! :-)

In INFO-HAMS Digest V90 #303, Bob, W3OTC comments on the new proposed
United Kingdom callsign allocations, and says::
>
>Who said that the American callsign scheme is complicated ??????
>
I *LIVE* in the UK, and may have to *PUT UP WITH* this farce of a scheme
for assigning new calls..... {start playing of sad violin music...}
The need to have a seperate call series for club stations passing third-party
messages(!) seems obscure and unnecessary to me, add this to the confusion
that the new 'novice' license will introduce, and i predict chaos! (BTW,
why do we need a 'novice' license? we already have one - its called the
'Class 'B'', no-code license - gives us six meters and up, full privileges).
I feel that the proposed call scheme is nothing more than the uninformed
scribbling of incompetent buffoons, and have written to RSGB expressing
my strongest disapproval of the new proposal. But i feel that i am a
lone voice crying in the wilderness...

Normally - I feel politics and Amateur Radio have no real common
ground - especially here on Info-Hams. However in this case I must make
an exception since what happened this week in Israel just might be the spark
that can eventually lead to peace in the Middle East - or at least a beginning
of something...
On March 27th, it was announced by the Ministry of Communications that Amateur
Radio operators can now legally communicate with 22 Arab countries that were
formally forbidden under the rules and regulations since 1948.
So far, nothing has been said formally on the part of our neighbors - but it
is too soon to tell. Jerusalem and Amman for example are in 2 meter repeater
range. 40 meter SSB operation during the day would give coverage into many
neighboring countries.(It would be nice to hear JY1 pop on to the Jerusalem
repeater on his way to work!)
Things happened in Eastern Europe recently after no one thought it was
possible... Why not here ?
Peace via Amateur Radio ??
This may be a real first...

To: chju336@emx.utexas.edu
Subject: WWV

One source of historical info about WWV / WWVH is the book "Achievement in Radio", by Wilbert F Snyder and Charles L Bragaw, available from the US Govt Printing Office (for maybe $55). I would think that the U Texas library might have a copy. It is an 842-page history of radio activities at NBS up through the mid-1970s. The section about WWV starts on page 263 and runs about 30 pages. If you absolutely can't turn up a copy of the book, I suppose I could copy the pages. This story isn't technical, or at least not very technical. Contacting somebody like Roger Beehler at NIST/Boulder, might lead you to more technical info. Note that the name was changed from NBS to National Institute of Standards and Technology about a year ago - congressmen at work.

Dig out you copy of the Amateur Radio Handbook or most any other handbook of radio and someplace you will find a list of the "INTERNATIONAL Q-SIGNALS". And, yes, they are still in use on the 'outmoded' mode of CW! Also there is another type of signals used on CW by the U.S. Military forces "Z-SIGNALS"

I have been asked via email to post the article, so here it is in full.
This article is being reproduced without permission from the Worcester
Telegram, Sunday, March 18th issue (ps, I fixed the misspelled name):

RADIO HAMS CAN BE BIG HELP IN TIME OF NEED

The Montachusett Amateur Radio Association is there when you need it. The
75 member club for amateur radio operators, popularly known as "hams," has
a long history of acting as a vital communication link in time of emergency.
But if you ask club members why they're involved, they'll tell you it's
because amateur radio is a lot of fun.

"It's quite a hobby," declared Gerald Jubb, an association member who got his
first ham license in 1934 when amateurs typically rigged up their own radio
sets. "You get into it as a kid and then stay the rest of your life," Jubb
added.

Local hams join the association to sharpen their skills and to share the fun
of ham radio with their fellow enthusiasts. The association also gives
classes so that aspiring hams can learn their craft and obtain a license to
operate. Of the 19 people in the current class, four are 14 years of age
or younger [Diana: two of them are my kids!], three of them girls, noted
Charles Cayen, the chairman of the club's membership committee.

FORMS OF COMMUNICATION

Hams can use a variety of formats to communicate, including voice, Morse
Code, teletype and computer. Many hams have handheld units and others
broadcast from mobile units in their cars.

Some operators, said Bill Wornham, get into the hobby to "chew the fat with
anybody and everybody." Some are particularly interested in foreign contact,
while others prefer getting involved in the technology of radio such as using
computers and satellites. The first non-government satellite ever launched
back in 1961 was for radio amateurs across the world and 12 more have been
launched since then, said Jubb.

But it may be the public service and emergency functions that make ham
operators and the club particularly recognizable. The association helps
ensure the safety of participants in local bicycle and foot races as well as
walkathons by providing communications along the routes and promptly directing
help to trouble spots.

DISASTER HELP

And when all other communications fail, such as during a flood, earthquake
or hurricane, amateur radio operators are there to help coordinate disaster

relief and get messages in and out of the affected area. During last October's quake in California, amateur radio operators passed 15,000 messages between the stricken area and the outside, mostly to family members concerned about the fate of their loved ones, said club member Wornham. Hams passed the same number of messages down to the Caribbean when Hurricane Hugo ripped through the islands last year, he added.

Wornham sent one inquiry to Puerto Rico for a co-worker who wanted to find out if her family was safe. She got a message the next day from an operator who telephoned her from Kentucky. Everybody was fine. Montachusett Amateur Radio Association members are also ready to spring to action when local emergencies arise. The association counts among its members Wornham, who is the Civil Defense director in Townsend, and Cayen, who acts as the northeast coordinator in Worcester County for the Amateur Radio Emergency Service, the volunteer agency that would coordinate ham efforts during an emergency.

Cayen remembers a few years ago, during a flood warning in the Fitchburg area, that volunteer hams went out periodically to measure water levels which they passed on to officials who were monitoring the situation. Hams are also called upon to report local road conditions during a snowstorm or weather conditions in their town during a tornado watch.

Jubb has been a ham since the 1930s when radio captured his imagination and he began building sets to send and receive messages. He made his first radio contact with a Springfield amateur in 1933 and he's been at it ever since. Jubb makes his contacts out of the same room where he began, in a converted closet in a 250-year-old house that was built by his family.

The association has its roots in the Fitchburg Radio Club which began in the 30s, Jubb recalled. In the 1970s, the Fitchburg Club merged with an informal group of operators to form the Montachusett Amateur Radio Club. The name was eventually amended to association.

In addition to offering classes, the club participates in the annual field day sponsored by the American Radio Relay League, the national association of ham radio operators. A sort of national disaster drill, the field day gives clubs across the country a chance to operate under emergency conditions and have their performance rated.

The club meets every second Wednesday, except in July and August.

-I have seen references to an FM Citizen's Band radio service refered to as
-the GMRS or maybe the GRMS service. This seems not to be the 11 meter
-Citizen's Band Radio Service, as that is limited to AM and SSB.
-I don't think this is a part 15 type service either, can anyone shed any
-light on what it is I keep seeing references to?
-Mark E. Sunderlin: IRS Technocrat in Winchester, VA
-aka Dr. Megabyte: megabyte@chinet.chi.il.us (703) 667-5203

Check out Title 47 CFR, in either part 90 or 95. (It's in with CB under the heading "Personal Radio Services".) It is FM, with a few channel pairs around 463/468 MHz. Repeaters are allowed within certain constraints, and buisness communications are allowed. If you'd like more information, please give me a call or E-Mail me directly. PS - How's Winchester this time of year? I grew up in Ashland, just north of Richmond. Are the apple blossoms out yet? Heard any good concerts at the conservatory? You're making me homesick!

I heard a sales rep for a cellular phone company giving a pitch in a shopping mall one day. The person he was pitching to asked about scanners. He told them, "scanners can't pick up this signal, it's distributed by SATELLITE and we use special encoding on it." I actually could not contain myself and burst out laughing, much to my fiance's chagrin :-). The rep gave me The Mean Face so I just walked on. Oh well.

That is just out-and-out fraud. Someone needs to deal with that.

Just my 2/100 dollars worth.

Fasinating! I suppose you talk MUCH more slowly than the average person.
Normal conversational speech is 120 wpm. I also must assume you never
work the weak ones or operate when there is QRM or QRN since you NEVER
ask for a repeat.

From personal traffic handling experience on both phone and cw nets
during the Vietnam era, I can say confidently that we passed MUCH
more traffic by voice than cw. Course we used the hi-tech of the
era, tape recorders for both out going and in coming traffic. Crisp
operating technique was a greater factor than mode, but the higher
speed of voice sure helped.

It seems that you anti-CW logic can be applied to ham radio in general. I suggest that if use your underlying premises that we could make an argument for turning all the amateur radio bands into Citizen's bands. Perhaps you might wish to expound on this topic for awhile!
As I have said before if your really wish to use voice pick up the land line.

Yes, stop by 1UP10, 15E, assuming you are in Fort Collins. (Just try
and get this information from YA-HOO.) I'll even sell a 212 service
manual.

Now what I really wanted to say. Sell it and by an ICOM-228A.
I'm much happier. The ICOM service people were much more reasonable
to deal with and the radio isn't such a lame duck (one of a kind).

I speak for me. I have had bad experiences with YA-HOO and will never,
ever buy their equipment again.

Thanks for making my day! Although cute, this is approximately the dumbest idea I've heard all week. No personal offense intended, but I think the writer is doing a disservice to potential new hams here. I am a VE, and I have seen a few guys try to write down dots and dashes and then translate after the test was over. Not one of them ever passed. They always get balled up trying to write the last string of dots & dashes while the next letter comes at them. The result is an untelligible mess. But now I can't wait to see some guy sitting there trying to remember his 26-word mnemonic string to reconstruct his binary tree from memory!!!

Let's relegate this myth about how some people CANNOT learn code to the same scrap heap that I hope most of us have used to discard the notion that some people CANNOT learn math. When people supposedly competent in a particular skill pass around the myth that some people are absent the capability of learning that skill, we give them a crutch that turns into a disabling handicap. Witness the whining over the code requirement that occupies about half the bandwidth of this forum. It comes from the same group that thinks they should get 3 hours credit for a full semester course in C.

Compassion has to be the first rule for all human endeavours. The problem is not with Morse Code but rather with the systems. This answer should have been obvious!

With all do respect, the NTS traffic nets on CW are quite active and
important. Packet networks will no doubt change that but they have not
yet.

Hm... I'm amazed by all of the garbage about MFJ. I have been using a Versa Tuner III for about 6 years now and it has never given out. The same goes for my 1274B.

Just because MFJ isn't a "big-name" company and doesn't package or advertise its products in a very slick manner doesn't mean that it's not a good brand. At least some of their stuff is made in the US!

1952. Re: QEX and other Ham mags.

Newsgroup: rec.ham-radio
Date: 1990-03-28 21:48:18 UTC
From: glenne@hpnmdla.HP.COM
Message-ID: <1250138@hpnmdla.HP.COM>
Source record: 12507

Paul
HR seems to have more consistent technical representation but like
the other mags is subject to the "NiCad battery charger syndrome"
(actually this month in HR it was a NiCad *dis*charger). QEX is Paul
Rinaldo's (w4ri) baby and has been struggling since most of the
solid technical authors don't want to publish there due to the lack of
circulation. QST pages seem to be at a premium and there is a tremendous
battle over them, you can see which priorities win. HR and CQ
(which generally seems non-technical) do seem to have the better
international coverage and availability.
I've chosen HR for my last few articles because of their willingness
to publish and international availablility.
I think the bottom line is that the magazines tend to try to appeal
to the lowest common denominator for sales and aren't especially
interested in technical articles, per se.
I'm afraid they are suffering from the same problem as the
hobby as a whole, a general lack of relevance to the information age.

BTW, what's your qth? It looks like we are pretty close.

I e-mailed this but optilink doesn't recognize you!

::An "archaic and useless" skill? I don't think so. You can't get away from
::CW -- on any of the ham bands.
::
::Irregardless, I'm not interested in cramming CW down anyone's throat, just
::in keeping the door open, something that I think the 5wpm test does well.
::Most of you must have realized that you don't really have to "know" CW
::to pass the multiple guess test at the VEC. In fact, I think all that it
::can be said the 5wpm test "guarantees" is that you can tell dots from dashes,
::keeping your options open to learn CW if it appeals to you.
::
::I really can't see how anyone can be against such an innocuous little 5wpm
::test -- especially in its current multiple guess incarnation.

It is my impression that *most* countries do not require 20 WPM for a
class of license. If memory serves me right, the UK requires 12, other
countries require 7 or 8 tops. Why, then, do we go through the
foolishness of requiring 20?

Perhaps Don has hit the nail on the head. Let's petition that the code
requirement for *all* licenses be dropped to 5 WPM (or 8 - 10 if you
want to stretch it a bit), and then let's ask that the theory exams
stress the type of stuff that people really need to know on the air.

The local (Phoenix) police and fire use some packet-like mode to communicate with computers in the vehicles, and my PK-232 signal analysis mode is unable to figure it out. I've also tried quite a few combinations manually, to no avail.

Sounds like about 2400 baud, and it's bursty like packet.

If anyone else figured out what formats commercial systems use, could you please post them or email them.

Thanks

Nobody is anti-CW. Nobody wants to abolish CW anywhere on any band. The only thing anyone want to do away with is making code proficiency the sine qua non on VHF and up.

You may now join the growing list of people who totally missed the point to the discussion.

1959. Re: Increasing CW Speed

Source record: 12514

1. The argument about the requirements for admission or graduation in college is not a good one. There are a lot of colleges around that have different and/or fewer such requirements. If you don't like the requirements at the one you are now in, transfer. If you can't get in this one, apply to that one. In education you do have a choice. If you have a problem with the lesser reputation of the schools that don't require calculus, english, and foreign languages, then I suggest you think about WHY the better schools have their reputations. If you were an employer, which school would YOU hire graduates of?

2. In Amateur radio you don't have much of a choice. CB doesn't get you anywhere (it's equivalent to the choice of NOT attending school). That's not to say that CB'ers are bad; I know some CB'ers who are good people. To get a ham radio license, you must pass certain tests; there is no alternative.

3. Knowing Morse Code does not improve one's operating skills on VHF frequencies anywhere near what it did many years ago on HF. Code is still popular on HF, and you would be a more rounded operator if you do know code when operating HF. But we (no coders) are talking about VHF (see #4) and above.

4. Most HF bands are now OVERCROWDED. Most VHF/UHF/SHF bands are way under occupied. Only 2 meters appears to have some significant usage in many parts of the country, but no where near that of the big 5 HF bands. The other "centimeter" bands are very sparsely occupied if at all. The numbers are needed on VHF/UHF/SHF and not on HF. We would not have this problem (and would not need a no code license class) if half the HF operators would start doing their primary operating on 220 Mhz and above. Come on guys, move on up in the world.

5. It used to be of benefit to THE PUBLIC to encourage knowing the Morse Code operating skill, because there was a demand for such radio operaters in various other services such as Maritime and Military. These demands and being phased out in favor of computer operating skills, which is what we should be encouraging next. The very reason for having a CW test in the earlier days of ham radio can be applied to require a COMPUTER TEST today (but we won't go so far). Just ask the DoD what they need.

> Perhaps you might wish to expound on this topic for awhile!
> As I have said before if your really wish to use voice pick up the land line.

First of all, I reformatted your message since the first 4 lines above
were actually typed in a one big long line, which also means the people
getting your message via INFO-HAMS lost much of it. The lines need to
be kept under 80 columns for some parts of the network.

Ham radio is something entirely different from the land line. Would you
still say "pick up the land line" if it went dead, or was overloaded, or
the computers running it crash (again)?

CB is a "land mobile" type service intended for letting ordinary people
have access to communications while mobile. With today's cellular phones,
CB could not be justified if it were being created today.

Ham radio and CB a very different. People do not do technical experimentation
on CB (legally). Ham bands are for that. At least here in the US we at least
pay some lip service in the rules to the ideas of advancing the state of the
art. Some of us are trying to re-establish ham radio's FIRST tradition of
invention and creation.

If these were commercial antennas, I would advise you to contact the manufacturer. They should have this information.

Since these antennas are probably home-made, I would recommend that you check out some of the articles published in the literature. You should be able to find two or three good articles in Ham Radio Magazine, from the middle 80's. Unfortunately, my mags are 2600 miles away, so I can't give you a better reference.

You didn't say if you wanted to stack them in the E-plane or the H-plane.

More info about stacking antennas:

The stacking distance strongly depends upon the gain of the antennas.

You also didn't specify what you were looking for. Do you want maximum
gain? Do you want a clean pattern? In which plane?

In general, I usually recommend stacking at just a short distance less
than the max_gain_distance. This will reduce the gain only marginally,
but clean up the pattern significantly. Sorry, but my literature is
2600 miles away, so I can't give any quantitative information.

It looks like this is a good place to post this message.

I am quite interested in getting into ham.

I have been CB'ing for a while and have grown real bored of it...I then
got into "bootlegging" the dx'ing with an out of frequency radio, and now
have decided to get into ham.

The only problem is, I have no idea even where to start...I was wondering if
anyone out there on the Canadian side (no offence, but I think Canada is different than the
U.S.A) that could offer some information to me.

Just the basic stuff, such as what it takes to become the Class C Novice and
what band restrictions there are etc...

Thanks in advance...

Dave (DR70)

>"Welcome to my fog! There's room for you, to come right in.
> Welcome to my fog..... I guess?!"

The service in question in GMRS or General Mobile Radio Service.
There are a limited number (8-10) of channels in the 462 Mhz
band. Some are repeater pairs, some are simplex.
Both personal and business communications are allowed, however
only an individual can be licensed (due to overcrowding by business
users). Existing business licence holders can stay until their licence
expires, however no new business licenses will be issued.

There is an address to write for more information, however I do not
Have it available. I am also looking for more information on GMRS,
so post away.

Hmmm. Nice to see a fellow UHF guy on the net, almost within reach without having
to use the moon ...

Lets see, 3m boom is somewhat more than 4 wavelengths. The antennae thus are quite long.
The usual recommendation if optimizing for gain is 2-2.5 wavelengths which means
1.4 - 2 metres apart. Omtimizing for space (communication) suggests smaller spacing in
order to minimize the backlobe. I somewhere saw 0.8-1 wavelength.

See you on 70
Chris.

What you are hearing is "commercial packet" It is in MMP protocol. Even
if you could capture the bits with your TNC you would spend the next
three lifetimes decoding the packet. Security is top on the list when
it comes to public safety. MMP is a proprietary Mobile Data International
protocol.

Radiokit, P.O. BOx 973, Pelham, NH 03076. I don't have their phone number handy. If you ask directory assistance, ask for Londonderry. That's where they are located, though the P.O.Box is still in Pelham.

I am neither an expert nor a lawyer, but would it be possible to have a friend take notes? Specifically, a friend who:
- Does not hear the code (i.e. headphones on the exam-taker) and
- Does not know Morse Code

Then the question becomes, is it permissible to take audible notes (talking while head-copying). Perhaps into a tape recorder, but then replay might be more difficult.

I don't know the legalities of this method, but I do know someone (my sister) who was allowed to take the SAT test with a (much younger, and therefore presumed less knowledgeable) brother filling out the form because of some reason she couldn't (I think a broken arm).

A slightly-off-the-topic question -- what about the requirement to send?

1977. Loading of Telephone Channels by Voice or Data

Newsgroup: rec.ham-radio
Date: 1990-03-29 18:17:04 UTC
From: DEFRANCO@TOPS20.RADC.AF.MIL
Message-ID: <12577606692.12.DEFRANCO@TOPS20.RADC.AF.MIL>
Source record: 12532

About a week ago, someone noted, while discussing thenon-existent FCC proposal to "tax" modem users on phone lines, that the telco's are still interested in such a proposal because transmission of modem data occupies a full 64 kbps "channel" while voice can be combined. I don't know what kind of carrier system he might be referring to, but at "baseband" levels, the standard system is the DS-1 channel bank that multiplexes into a T-1 data stream at 1.544 mbps. Each individual voice channel is converted from analog to digital by sampling at 8 kilosamples per second, then coded into 8 bits per sample. Thus, a 64 kbps datastream is created from ONE VOICE CHANNEL. If your modem is operated over a standard voice grade telephone line, and your local telco uses digital switches, your modem signal will also be converted into a 64 kbps data stream. There is no difference as far as the switching equipment is concerned.

The telco's concern is related to the amount of time that modem users spend connected through the system compared to voice users. Telephone switching centers or "Central Offices", whether analog or digital, are sized using probabilistic predictions of subscriber use. If large numbers of long connection times are expected, moretranmission paths and generally more switch capacity are required. Modem users generally stay connected longer than voice users (unless, of course, you are raising teenagers, at which point probability goes out the window), and affect the traffic flow accordingly. The telco argument is that if you are connected longer, you should pay more.

Ironically, it is the true digital channels that can be multiplexed into higher level datastreams to provide greater capacity per channel. While one voice circuit requires the full 64 kbps, up to 6 9600 bps channels could be multiplexed into the same data space.

>>
>> These are the SPREAD SPECTRUM communication signals. There are
>> usually two modulating signals. One is the useful signal which

>My quess is the continuous sweeping is some sort of OTH backscatter radar.

Once again, let us put this question to a rest. The sweeping carrier is a CHIRPSOUNDER. Used to track ionospheric conditions. There are several locations (All Military) in the world, where these sweeps are made according to a predefined schedule. The schedule itself is in the (I believe) lastest issue of Popular Communications.

In addition to reading this newsgroup, anyone with a serious interest in radio communications should subscribe to Popular Communciations (or get it at your news stand) and Monitoring Times. Glenn Hauser's two magazines are probably also very useful, though I have not managed to part with the subscription fee yet...

To the person who replied to my PockaPock posting (the funny sputtering sound I noted on 75 meters) I am quite sure that he is right, and that the sound eminates from frequency hopping radios (military). This leaves the funny BURST type (Obviously Digital) transmissions that I regularly hear on 75 meters very early in the morining. I was told that these are used in conjunction with Radio Navigation for USAF planes, though none of my friends in the USAF "will confirm nor deny".... It IS interesting to note though that on the night Norriegga was being ferried to the USA, that the well known Cuban CW jammer that trashes up the entire 75m band was out in full force, and making a shambles of 75 meters (though the cuban's fundamental is 3922, his spurs are LOUD on 3950, which also happens to be where I often copy the one second digital bursts (they are NOT any type of signal I am familiar with, but obviously ARE digital)...

Where is HAVANA MOON to solve these mysteries... I know he reads this group......

1980. Re: Code vs No-Code

Newsgroup: rec.ham-radio
Date: 1990-03-29 20:45:49 UTC
From: megabyte@chinet.chi.il.us
Message-ID: <1990Mar29.204549.10987@chinet.chi.il.us>
Source record: 12535

As I understand it, the basis for the communicator, or other no-code radio licenses is to provide for those person who wish to operate in the VHF, UHF, and EHF spectrum. The idea is that thses people should be able to get a license wtihout having to take aa code test. The VHF and above sees little CW action compared to the HF bands.

I can see the point being made, but my question is this: With the novice and tech tickets being replaced by some type of a "no-code" ticket, won't that make the very bands we want populated by experimentors populated by the least experienced, least educated, radio persons?

I'm NOT supporting a code requirement, I'd just hate to see the No-code ticket be "bottom rung" of the license structure. Mainly, because I'd think we want the entrence level ticket to give the new ham a taste of as many different type of ham radio as possible.

Seems to me that we still need something where a person can get an entrence level ticket, explore all aspect of Ham radio, and learn. But, I can also see that we might need a no-code ticket for VHF and above.

How can we get both? Got me. My perspective is from a SWL who is studying to get his novice license. I'm trying to hurry up before the rules change. Right now, I get a little of everything in Ham for my novice ticket.

With the current communicator proposal, I'd have to get a general class ticket before I could operate anywhere but on VHF and above.

>yet.

Note that I said "nil", not "zero". I'm sure there's *some* public service traffic carried by CW, but I find it hard to believe that it's more than negligible. However, I would be open to statistics on this point.

By the way, note that I didn't limit my assertion to amateur radio; lots of radio services besides the amateur service carry public service traffic, and to my knowledge few use CW to do so. A fair comparison would include these other services, since much of the amateur use of CW for traffic handling is due more to inertia or the personal preference of the operator than to it being the best mode for the job.

From: john@anasaz.UUCP
Message-ID: <1545@anasaz.UUCP>
Source record: 12538

I just got my 721 display upgrade in the mail (Cost: $40+$1 S&H). Installation took about half an hour using small phillips screwdriver and solder iron. Now I can see it in the bright sunlight (at least, I think I can - our usual sunny weather is cloudy today!). It has black numbers, with a yellow background - just like the TM-731.

I think Kenwood should be commended for doing this. They could have just told everyone to buy the next model (the 731), but instead they are supplying a replacement display (readable in sunlight) for an old one!

+I am considering renewing or starting subscriptions to various HAM magazines,
+and would appreciate comments or suggestions.
+My priority list goes something like this:
+1) Technical content
+2) Technical content
+3) Technical content
+4) Operating practice, band openings, etc
+...
+98) Contests
+99) Silent Keys (unless I am listed; that would concern me :-(
+
+QST, Ham Radio, and 73 Magazine are locally available, so I have a pretty
+good idea of their content... how about QEX or others I may not be aware
+of? Any good newsletters?

Well Paul, my list is similar to yours..but I notice you give a damn about chasing awards..I simply don't! My ranking:

1-98) Technical Content
99) FCC ACTIONS, NPRMS, etc

Puts QEX near the top of any list, yes, I do subscribe to QST also but tend to read it last! Ham-Radio is next, and equal in stature to the AMSAT monthly pub, 73 magazine is fun so I usually read it for the fun that Wayne pokes at the "Newington-Nerds" every month. CQ magazine is normally for, er, uhm... ..shall we call them, 'transition operators'..?! You know, CBers on the verge of finally growing up, and getting their ticket. ;-) As for the smaller, club/specialized activity-oriented pubs there are some really great ones; like the TAPR Journal, RTTY Times, DSP Picture, So Cal. ATV's rag and the like... ..then there are ones like the OLD-Old-Timer's Club, which is filled with obits, ancient tube/radio ads, notices of ex-XYLs having estate-sales (some real bargains out there!) and the nominal letters to the Editor ("..these damn kids don't know what fun IS! Packet phooey! We used to run an 813 as an oscillator on 40 meters with an antenna made from old barbed-wire on my Dad's farm back in 1930...blah, blab, blather!") and a calander of upcomming events - Yawn! The only value in this sort of junk is the letters, and the ocassional sideways editorials. Try it.

73! Erik

(as an aside: Given my druthers, it would be great if QST were to take all that damn contest garbage out of the magazine and put IT into a special pub for those that care about it..and want to pay extra for it being printed!...HINT! HINT!..then they'd have room to publish the kind

of quality tech-stuff that I buy QEX for! ;-))

+handicap. Witness the whining over the code requirement that occupies about
+half the bandwidth of this forum. It comes from the same group that thinks
+they should get 3 hours credit for a full semester course in C.
+ AA6KX

One minute, the question isn't about learning CW. The discussion centers around the notion that the requirement of CW skill @ 5 WPM is obsolete. You should decide for yourself, of course, but consider the matter a little more; consider these categories:

1) Keep it all as is. No new class of license. 5 WPM = Novice & Tech, 13 for General and Advanced and 20 WPM for Extra. (call this viewpoint "STATUS QUO")
-- kiss the Amateur Service goodbye! The Land Mobile guys love it!

2) Have a Communicator Class license, as proposed. No code, but with very restrictive band/power privs. (call this one NO-CODE GHETTO)
-- add 10-15 years to the timescale, THEN kiss it goodbye!

3) Have a Communicator Class license with the same band/power privs as TECH but with no HF privs. (call this one NO-CODE TECH)
-- add 20, maybe 25 years to the scenario of #1.

4) Do #3 and then ELIMINATE the requirements for CW beyond 5 WPM for all other classes of license. Maybe make the written tougher and more comprehensive regarding Radio Science, the laws and operating conventions. (label this view THE FUTURE, and count on CW being dropped by the ITU, as a requirement for Amateur Operations at a future date!)

-- Keep The Amateur Service FOREVER!

The slant in naming is mine, and I'll admit my bias towards #4, it seems to loom on the horizon, the only thing standing in the way is an ocean of people that insist on paying lip service to an outdated notion...the notion that good communication/engineering skills are rooted in CW. It just ain't so...

Notice I said notion, not mode! I'll continue to use CW as it's appropriate to do so, but only for the sheer entertainment value of working weak signal stuff...not everyone is so easily amused! ;-)

GMRS is formerly known as "class A" CB and oeprates on 8 pairs at around 462.5MHZ. The regulations section is part 95, sub part A. The FCC has recently ruled that GMRS is for personal use only and no more businesses will be granted GMRS licenses. All businesses now using GMRS will not have their licenses renewed. Any citizen may apply for a GMRS license using the business license application but there is no need to explain why you need a license, contrary to the requirements for a buiness service license, so you need not fill in that part of the form. (I forget the form # - 510?)

You can use any FM radio type-accepted under part 95 (and most that are type accepted for business radio are also accepted for part 95), including hand-helds and pagers. Repeaters are allowed on this band and may either be open or closed, depending on the owners wishes. You may use a closed repeater for a monthly rental fee of at least $20.00 a month. Radio prices range from around $100.00 for old crystal-controlled hand-helds to several hundreds for modern synthesised gear or even several thousands for scanning transceivers and other state-of-the-art goodies. If you want to use every channel, you could require as many as sixteen channels -one each of duplex and simplex.

I know this is a somewhat subjective topic, but I'm
interested in people's opinions of what make & model
general coverage receiver (say, 500 Khz - 30 Mhz) HF
for around $1 kilobuck would be worthwhile.

We need something which will be stable enough to make
tuning of SSB and RTTY reasonably easy, have bandwidths
good for CW, RTTY, SSB, and AM and is a "shack" (as opposed
to mobile) rig.

During times when experiments are not being run in the lab, it
could be used in conjunction with a ham station we are trying
to set up. Should be well shielded since we got a BUNCH
of electrical noisy equipment in the engineering bldg, particulary
class B computer systems.

I'm searching thru back issues of the ham mags for reviews, but
am also interested in personal opinions. Of course, I'm
considering ICOM, Kenwood, & Yesau. Any others? Digital control
would be nice, but is not critical. Would we do just as well to
go with a transiever as a straight receiver? How about the
IC735? IC751A (if I can get that much money)? R71A? TS440S/AT?
R-5000? R-2000? FRG-8800? FT-757? others?

Please E-Mail me back, since due to a disk space crisis we are
not accepting rec.* groups (sigh) (although I am getting the bitnet
gatewayed digest).

I agree that there should be a no-code license one can get that is other
than an entry level license. I also believe would should retain an entry
level license as the Novice is.

There does NOT have to be one single point of entry, nor does there have
to be one ultimate goal.

The 90-55 proposal stinks because it ruins ham radio and sets up a nocode
system that is doomed and will reap worse sentiments among hams than was
ever imagined with incentive licensing.

[all above are my opinions]

The comments are available on file at the Washington offices for examination during business hours. They are not distributed. They are public files and you may copy them if you wish. You may pay someone to go there and copy them for you. The FCC has contracted with a commercial copy contractor to provide this service. You can contact them; they are listed in each Report and Order from the FCC (see any library that receives the Federal Register).

> juha nurmela, oh5nxo, junki@kannel.lut.fi

According to the ARRL Handbook (which may or may not be the best source of this info), optimum spacing between long yagis is one wavelength- this would be the position for maximum gain. Closer spacing results in less net stacking gain, but a cleaner pattern.

According to the 22nd edition of the Radio Handbook by Bill Orr, W6SAI (which may or may not be the best source of this info- where did I just hear that? :^)), "...as a simple rule of thumb in stacking extended Yagi antennas, or other arrays having high gain, it is suggested that stacking distance be equal to 3/4 of the length of the antenna."

The numbers I have personally seen for stacking 432 antennas, seem mostly to run in the 60 inch range, for antennas such as the Cushcraft 424B which has about a 17 foot boom. This suggests a compromise between the previously mentioned references, and it may be that the gain degradation by spacing closer may not be as much of a loss as the pattern degradation by spacing them wider.

Bottom line, I'd start with about 60 inch spacing, I bet you'll be close to optimum. If your station setup allows, you can play with the spacing while measuring Sun noise when the Sun is just clear of your horizon. If you can't do that, just space them 60 inches apart and leave it- it'll be real close.

Hope this helps some.

Source record: 12546

I recently obtained a PK232 and want to use it with my 02AT on VHF.
Any hints or suggestions for setting the deviation, interface cables,
etc. would be appreciated. Please post to the net since other people
may be interested also.

BTW, I enjoyed Phil Karn's article in QST. I hope the OF's in Newington
aren't using it as their April Fool's article.

It took a while to locate and type this. The following is excerpted from articles in _The Lowdown_, April 1987. (Copy of complete articles for SASE.) _The Lowdown_ is the monthly newsletter of the Longwave Club of America, whose major interests include operation in the 1750-meter band, which is license-free with the restrictions of one watt transmitter power and 50 foot maximum antenna length.

LITZ WIRE AND 1750 METER LOADING COILS

by Mitchell Lee

Litz wire is a favorite among LF enthusiasts. It is commonly held that litz wire possesses magical properties that obsolete any other type of wire. While litz falls short of some of these claims, it can provide a significant improvement in loading-coil quality factor and transmitting efficiency. When winding a coil with litz wire it is a good idea to plan in advance as to which type to use...

Litzendraht wire was developed as a means of reducing skin effect. As the frequency of an AC current in a wire is increased, current is forced out to the surface of the wire by the magnetic field generated from the current itself. If this argument is carried to extreme, all of the current ends up flowing on the skin of the conductor and no current flows at the center. Skin effect causes the AC resistance (loss) to be greater than the DC resistance. It is even significant at frequencies as low as 60Hz, where it often enters into AC transmission line design calculations for long lines.

There are two ways to combat skin effect. One is to use a larger wire diameter so that the surface area... is relatively large. This works well at shortwave frequencies and in some cases copper tubing is used to save weight and material... Sometimes the conductor may be coated with silver to enhance the conductivity at the surface.

A second method is to break the conductor up into a bundle of many individually-insulated conductors. This is the same as paralleling many wires... Each strand is sized so that its diameter is equal to approximately 2 skin depths or less, for optimum results. Litz wire fails to be useful at frequencies above 2 MHz, as capacitance effects begin to dominate and the relative size of a single conductor with

similar loss characteristics becomes small enough to be practical.

Skin depth is the thickness of conductor where the majority of AC current is concentrated. The AC resistance of a given conductor is approximately the same as the DC resistance of a hollow tube having a wall thickness equal to one skin depth. Skin depth is given by the equation

skin depth (cm) = 5033 sqrt(p/uF) (Terman)

where p (rho) is in ohms/cm^3, and F is the frequency in Hertz. u (mu) is the relative permeability of the conductor. For copper, the formula reduces to

skin depth (inches) = 2.61 sqrt(F)

At 175 kHz, the skin depth is approximately 6.2 thousandths of an inch. If we select a wire that has a diameter of 2 skin depths #28 AWG) or less... all of it will be carrying current. If the wire is 6 skin depths in diameter, less than half of the wire will actually carry current. To minimize losses for a given diameter of finished conductor, we should use litz wire made of strands that are no larger than 2 skin depths diameter.

This is only a first-order approximation. Air space between the strands in the cable, capacitance effects, and the fact that the definition of a skin depth holds true only for a big wire, will limit the accuracy of this approximation. But, it is good enough for LF work. At 175 kHz, a cable of numerous 28 AWG strands is the largest practical size...

There is a limit on how many strands remain cost effective. If more and more strands are added into a litz wire bundle, the wires in the center begin to feel the effects of the outside strands through mutual coupling. The impedance of the wires on the inside is higher than... on the outside of the bundle...

To help improve this situation, an attempt is made to transpose the strands in a litz bundle so that each one weaves a path through the center, outside and middle, thereby equalizing the impedance of each strand. This is difficult to achieve in practice, particularly where large numbers of strands are used. The same method of transposition is used to balance the impedance of 3-phase, 60Hz high tension transmission lines. You may have noted an occasional tower with extra framework and insulators; if one looks closely he can see that the relative positions of the cables are being switched around.

If smaller individual strands are used, the losses do not necessarily go UP. Instead, the DC resistance more nearly approximates the AC loss. While a 10 AWG wire has much higher AC loss than DC loss, it is still superior to a single 44 AWG conductor. But much less copper would be used (and the overall outside diameter greatly reduced) if the 10 AWG conductor was replaced with a number of 28 AWG wires. This

is because all of the copper in a 28 AWG wire does work carrying current, where only the skin (the outside .062") of the 10 AWG does any work...

[Coil construction information omitted]

Common litz wire sizes also dictate the use of a strand size no larger than 28 AWG. For instance, Kerrigan-Lewis only stocks litz of 30 AWG strands and smaller. Given the constraints discussed, 34 or 36 AWG strand size is still a good compromise. 60/36 (60 strands of #36) has the lowest practical loss for stock sizes. It is also available as 3/30/36 (3 bundles of 20 strands of #36), with no difference in loss. 175/40 is another stock size of similar low-loss characteristics, but the coupling between individual strands may degrade its AC loss.

Litz wire is available from Kerrigan-Lewis Wire Products, 4421 W. Rice Street, Chicago IL 60651 (312) 722-7208. They manufacture much of the litz wire that is used in the US. Other companies that advertize litz often buy it from Kerrigan-Lewis. If you buy some litz, make absolutely sure it is solderable. Soldereze and Nyleze are two common insulations used on litz wire. The temperature of the average soldering iron is sufficient to cause the insulation to melt and evaporate, leaving the wire exposed for soldering. Other insulations must be removed chemically-- an unnecessary inconvenience.

Keith Henney: The Radio Engineering Handbook, Third Edition, 1941, McGraw-Hill.
Fred Terman: Radio Engineers' Handbook, First Edition, 1943, McGraw-Hill. Not to be confused with the much more common and vastly inferior Fourth Edition, 1955, which bears the revised title Electronic and Radio Engineering. The 1955 edition was compiled at a time when Terman began losing interest in engineering and electronics in favor of administrative pursuits at Stanford. The fantastic coil chapter was dropped in the 1955 edition!

LITZ APPLICATION GUIDELINES

(Reprinted in _The Lowdown_ from _Design Engineering_, February 1, 1979, "Multistrand Litz Wire Adds 'Skin' to Cut AC Losses in Switching Power Supplies," by T.A.O. Gross.)

1. If your present design uses a ferrite core, you should be using Litz on the high-current windings. If Litz does not help, the choice of ferrite was wrong in the first place. Most switching chokes should be using thin silicon-steep cores or Supermendur.

2. The biggest benefit from "Litzing" a coil comes in large reactors of low impedance working between 20 to 200 kHz. The high-current windings of flyback transformers are equally good candidates.

3. Thin foils compete with Litz and offer the advantage of better space factor. The disadvantage is that losses can be high due to fringing fluxes.

4. Transformers with large air gaps have large exciting currents, which in turn produce strong perpendicular magnetic fields. Very often it will pay to put the air-gap function elsewhere - in another component - so that the fields are out of harm's way.

5. Don't use solid round wire larger than AWG 8 for anything carrying 20-kHz current. Don't use wire larger than AWG 20 in 20-kHz transformers, or AWG 28 in 20-kHz reactors.

6. Balun and transmission line transformers are the least likely projects to make you a hero by Litzing.

7. Estimate the probably Rac:Rdc for inductors, flybacks and loosely coupled transformers using the ferrite pot-core applications data for the general size of the device you are designing. Keep in mind that Rac:Rdc gets worse with increasing size and decreasing impedance.

8. If the dc component exceeds the rms ac component by an amount greater than 10 times, you can forget about every rule in this table except rule #1.

> 70 cm, 15 elements each, boom len about 3 meters.
>
The ideal spacing is one wavelength to maximize the gain. This is
70 cm = 27.5 inches. I believe that one could also stack at multiples
of one wavelength to achieve the same characteristics, but I would
have to go through some calculations/computer simulations to be
certain this is true.

Another important consideration is feeding the array. Both Yagi-Uda
arrays need to be fed in-phase, plus you must maintain proper
impedance matching at the feedpoint, as follows:

Yagi #1 Yagi #2

--- ---
\ / \ /
l_____________________l
Point A l Point B
l
l 50 ohm feed line
/\
Need to see 50 ohms looking in

The phase at point A = phase at point B. As far as how to do this, I
believe both the ARRL antenna book and the ARRL Handbook both show
methods for providing this feed mechanism (I know I've seen it in older
editions). If you can't find it, email me a message (via UUCP given below)
and I'll send you the details.

73's.

>
>I think Kenwood should be commended for doing this. They could have
>just told everyone to buy the next model (the 731), but instead they
>are supplying a replacement display (readable in sunlight) for
>an old one!

I have also ordered the upgrade for my 721A... However, while I am
pleased thay they are providing the display, it has taken over 6 months
from the original estimate of when it would be available. I have been calling
Kenwood every month since September to hear that it will be hear next month.

I do own a lot of Kenwood gear, but the 90-day warranty on their gear,
and passing of bad information for 6-months is not big on my list of
what I expect from a company. With this whole sequence of events it is
likely that I will consider Yeasu and ICOM for future radio needs that
I would not have done before...

Just my thought,

Phil

From: elliott@optilink.UUCP
Message-ID: <3336@optilink.UUCP>
Source record: 12554

As the original question-asker (What's a good technical ham radio magazine these days, anyway?), I've received numerous replys. Here is my thumbnail summary:

QST: Generally lost in the dark ages, occasional good stuff however.

QEX: Skinny, merged with Gateway (ARRL packet/digital newsletter), pretty good but could be better.

73: Low-tech, appliance operator oriented

CQ: (see 73:)

Ham Radio: Generally the best technical articles

VHF Communications: (an English translation of a German magazine)
100% technical content. Available through Timekit in Ohio.

I guess I will re-join the ARRL to get QST, subscribe to QEX and Ham Radio. _VHF_Communications_ looks interesting, I will try to locate Timekit and get it. I will let you all know if anything interesting appears.

Yes, I know that the ARRL isn't too popular these days, but I figure they at least do more good than harm for the hobby as a whole.

In article <>, glenne@hpnmdla.HP.COM (Glenn Elmore) writes:

Source record: 12556

Hi Netlanders,
One of the hams at this site also repairs radios on the side (no this isn't a commerical for him!). He has repaired a lot of Yaesu 727R radios(a lot being 3 or 4) in this area where the trouble was caused by loose slugs from the tuning coils. The loose slug is conductive and typically shorts out a transistor which in turn inhibits xmit on both bands. Letters to Yaesu bring no answer as to why this is happening.

If you have had a problem like this, send info to me and I will forward it to this fellow. If anything exciting comes of this I will let the net know.
Thanks,

> requirements at the one you are now in, transfer....
>2. In Amateur radio you don't have much of a choice....
True, its our only college and hams have a big say in what goes on.
So when enrollment is down, you have two choices: 1. Figure its a symptom
of society and try to maintain standards of quality. 2. Figure its a symptom
of problems with ham radio and try to reduce standards to get enrollment up.
The evidence seems to point to conclusion 1. Thinking hobbies are
down all over the place and TV is up. If you support conclusion 2 though,
you won't be alone, you'll be following the path of untold numbers of high
school and college adminstrators all over the country. This is a very safe
path to take. The arguments have been handed down generation to generation
and usually work.
I'm not really interested in getting the best operators on the air.
Or of making the most efficient use of spectrum (this is a HOBBY for
christsake). I am interested in the learning aspect of ham radio and
feel that it is the best intent of ham radio. Incentive licensing is a
great way of tricking people into learning something potentially useful/fun.
(Yes, and people need to be tricked, you're fighting the biggest trickster of
all after all -- TV).
Morse code is Ham Anthropology/Archaeology 101 it is also Digital
Communications 101. Its the closest you'll ever get to BEING a modem.
And most of all, its a communication mode. Being apprentice communicators
we should learn it. The problem is, the other newer modes are not as
heavily stressed as CW. If there was more coverage (more tests?) in the
other modes, there wouldn't be such complaints for the 5wpm CW test.
CW is used in 1990. Phil, you mentioned that many repeaters now
ID with voice instead (or in supplement) to CW. True, there are more of
these. However, you'll notice that getting the hardware together to
do a voice ID is such a pain compared to a simple CW ID that those repeaters
usually have stuff like digital playback/S-meters too
(ie. they are well funded). Is CW a useful, cheap, and simple mode to use?
I'd say yes, and people are voting with their repeaters on this one.
Your arguments for abolishing the CW requirement for VHF are
compelling, however , given extra questions in other areas to replace it.
The problem is, most of the anti-code proponents seem to just want to
water down the tests. So it's much "safer" to try to resist change.

2007. 49Mhz conversion question

Newsgroup: rec.ham-radio
Date: 1990-03-31 01:11:43 UTC
From: roger@hpfcmgw.HP.COM
Message-ID: <1690050@hpfcmgw.HP.COM>
Source record: 12562

I have just acquired a set of "Voice Actuated Audionic FM Transceivers" manufactured for Realistic (Radio Shack). Currently they are on 49.845Mhz along with all the baby monitors in the world. I'd like to move them up some 250 Khz to the six meter phone band.

Can anybody direct me to articles which may have been published in some of the amateur radio magizines on moving such equipment up to six. Or may-be there has been some discussion on the net. In general, should the move require massive retuning? By that I mean, will I need to swap out coils or is it simply a matter of tweeking the existing coils?

I would also like to crank the power up a bit. The final output transistor, a 2SC380 is rated at 650mW. The spec on the power output as listed in the service manual is 80dB. I'm not sure what that means.(80dB relative to what?) The final output stage is a common emitter configuration inductively coupled to both the antenna and the driver/tripler stage. I assume that by simply increasing the current in the emitter by reducing the value of the emitter resistor I should be successful in my pursuit of higher power, as long as I don't exceed the maximum emitter or collector current ratings or power dissipation of the transistor. Am I on the right track? (Schematic below)

I would appreciate any help that I can get.

73,

Roger Jollis, KU6I

Actually, there is a satellite-based cellular phone service being developed by JPL and NASA called MSAT-X. It is not yet operational (in a commercial sense), but hopes are that it someday will be.

**** UoSAT-OSCAR-11 BULLETIN - 211 26 March 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** UoSAT-OSCAR-14 ** (de G3YJO)

The gravity boom on UoSAT-3 was deployed successfully under on-board computer (OBC) control on Thursday morning (220390), following attitude control manoeuvres to 'lock' the spacecraft to the Earth's magnetic field. The attitude manoeuvres have been complicated by offsets experienced in the on-board magnetometer (which is used for attitude determination), requiring additional software filters to be included into the attitude control algorithms running on the OBC.

Following deployment of the boom and its 3.5 kg tip-mass to about 6 metres from the top of the spacecraft, delibration algorithms have been activated on the OBC to point the spacecraft towards Earth.

** UoSAT-OSCAR-15 ** (G3YJO)

The team at Stanford, having succeeded in detecting local oscillator (LO) leakage from the UO-15 command receiver, are now listening when the satellite is in eclipse - to determine whether the on-board NiCd battery is functioning.

** DOVE-OSCAR-17 ** (ASR)

Following the CPU crash on-board DO-17 which left the 2m transmitter ON,
command stations were unable to access the satellite receiver due to blocking.

On 170390, the AMSAT Engineering Team successfully reset the CPU on DO-17 and
commanded the 2M transmitter off. Dave Blaschke (W5UN), the owner of the
world's largest privately owned 2 meter antenna, worked with Harold Price
(NK6K) to overcome the desense problem (DO-17's command receiver is also in
the 2M band). Even with 32.5 dBi gain, and nearly 2 megawatts of EIRP, it
took several days of transmitting the reset sequence before they were
successful.

Alberto Zagni (I2KBD) reported that the transmitter power was dropping
significantly at the end of the eclipse portion of the orbit which indicated
that the batteries were flattening out. Bob McGwier (N4HY) then strategized
with W5UN as to the two best times to reset the spacecraft CPU and turn the
transmitter off. The first was at the end of the eclipse period, when
transmitter power would be at its lowest point. However, if it turned out
that the battery voltage was too low to maintain the GASFET preamp in the
receiver, then the next time to try was just as the transmitter power was
falling off (soon after it left the sun and started the voltage descent in
eclipse). The latter was the time which turned out to be successful.

The AMSAT Team is reviewing the events of the last week to determine the
failure mode. Once they have completed their investigation, they will upload
the operating system for DO-17 and continue commissioning. DO-17 is not
expected to be fully commissioned until sometime in April.

>The ideal spacing is one wavelength to maximize the gain.

This is not true. The maximum_forward_gain_spacing is a function of the gain of the antennas being stacked. It could also be (almost equivalently) considered to be a function of the boomlength of the antennas being stacked.

There are also other considerations. Do you want maximum forward gain? Do you want maximum front-to-back ratio? Do you want maximum front-to-side ratio? Do you want some combination of these merit figures, like almost maximum gain with a clean pattern?

>protocol.
>
I hate to burst your bubble, but I know of a fellow radio hacker
who has been successfully copying mobile data terminal traffic in this
and several other so called "secure" proprietary protocols. He uses
modified commercial trunking capable radios with their built in FSK
demods to receive the bits and a combination of a stand alone micro and
an IBM PC clone to interpret the messages contained therin.

He says most of the bits are used for various forward error
correction and parity schemes. Encryption seems mostly to mean using
proprietary alphabets (substitution cipher), overlaying the message with
a LFSR sequence (scrambling, such as used on many modems), and XORing
the underlying message or sometimes the encoded data after adding the
FEC bits with a fixed multibyte pattern that is changed from time to
time. (For example he says IBM field service transmissions to their
portable terminals seem to use a 4 byte sequence changed every day and
different for each terminal)

I do not believe that aside from Motorola's line of DES based
DVP products (which really do use DES in a quite strong mode) most
two way radio security is very secure. I personally think it
pretty inexcusable for the manufacturers of these devices not to
use DES or some moral equivalent - merely deciding that the protocol
is complicated and nobody out there is bright enough to figure
it out is pretty stupid in my opinion....

Of course the fellow who broke these mobile data systems was
trained by the military as a cryptanalyst twenty years ago, so perhaps
that isn't completely fair. But there are people who do this sort of
protocol software work for a living who wouldn't find it hard either.

```

Including the attitude of many hams that "I'm the communications expert. Leave me alone and don't try to teach me anything" when public safety organizations like Red Cross, OEP, the police or whomever want to offer training to the local hams for disaster communications. The big selling point for ham radio over cellular or other two-way radio ops is that there is a large pool of people who own radios and have a tradition of being available as unpaid (the rules say we can't be paid anyway), TRAINABLE bodies that can replace or supplement an overloaded communications network in a disaster.
That selling point won't wash with organizations that have already had bad experiences with ham groups insisting on handling traffic their own way and trying to make command decisions without the training or authority to understand what is going on.
I was the Disaster Communications Chairman for the Monroe County Chapter of the Red Cross in Rochester, NY. Believe me when I tell you, ARES/RACES was the most difficult local volunteer group to deal with when it came to trying to get them to comply with Red Cross needs and procedures. This in spite of the fact that the person trying to train them was a licensed ham.
As one example, I was responisble for communications (for Red Cross) from the command post at a chemical plant fire in Brockport, NY a couple of years back. The NCS at the RARA club station, which is located near the OEP office downtown, pulled his radio operators out when _he_ felt the operation was over. Red Cross still needed radio operators for the recovery phase. The RACES Radio Officer decided that _he_ was in charge of the radio operators and would deploy and release them as he saw fit. This is typical of that organization in my area.

ARRL Letter - March 16, 1990 - Volume 9, Number 5 - Page 1 of 3

ARRL COMMENTS IN NTIA SPECTRUM MANAGEMENT INQUIRY

The National Telecommunications and Information Administration (NTIA) which shares responsibility with the FCC for management of the radio spectrum, recently began a comprehensive policy review of the use and management of the radio frequency spectrum in the US. The NTIA Notice of Inquiry (NOI) was published in the Federal Register on December 8, 1989. The NOI invited comments from the public on a wide-ranging series of questions. (See ARRL Letter Volume 8, Number 25.)

On February 23, 1990 ARRL Counsel Chris Imlay, N3AKD filed comments on behalf of the League. In its opening comments ARRL said "The League has been a participant in the spectrum management process for its entire 76 years of existence -- virtually the entire history of radio regulation. From that time until the present, the history of radiocommunication [contains many] examples of concepts being developed and implemented by radio amateurs that subsequently were adopted by the commercial sector.

"While improvements in spectrum management policies are needed... the public interest cannot be measured solely in the economic terms of marketplace forces. Just as public policy requires that there be public parks and other open space for the nourishment of the human spirit, so must there be `open spaces' in the radio spectrum where the public can pursue personal, non-commercial ends. This is the essence of the Amateur Radio Service.

"The value of the Amateur Radio Service is recognized internationally... virtually every country in the world makes provisions for the licensing of radio amateurs... A close correlation has been noted between the extent to which a government encourages Amateur Radio, and the level of technical development achieved in that country.

"On behalf of present and future licensees in the Amateur Radio Service, the League respectfully urges that considerable weight be given to the protection of this access in the present proceeding."

The League commented on certain of the questions posed in NTIA's Notice of Inquiry including:

- Encouragement of spectrum-efficient technology:

"The greatest impediment to the introduction of new technology...is the lack of an incentive for more spectrum- efficient techniques to be implemented within each existing service... the opportunity to seek new allocations simply relieves services of the obligation to use their existing allocations to full efficiency. If a service, or those who regulate the service, cannot efficiently use a block, it is puzzling why they should be permitted to expand into other services' blocks.

"A case in point is the land mobile service's apparent inability to find a way of incorporating `narrowband technologies' into their existing extensive allocations instead of seeking reallocation of 220-222 MHz from the amateur service to land mobile. It would seem logical that if narrowband technologies were more efficient than existing FM communications in the land mobile bands, then these technologies could displace FM and make room for additional assignments within existing land mobile bands."

- Alternatives to apportioning and valuing spectrum:

"Any discussion of alternatives to the present system of apportioning and valuing spectrum should not overlook a primary Congressional objective: the promotion of safety of life and property through the use of wire and radio communications (Section 1, The Communications Act of 1934). The Amateur Radio Service exists as a non-commercial, volunteer-based system that provides critical life-and property-saving communication services at no cost to the public, private or government sectors.

"Congressional support for the Amateur Radio Service was expressed in Public Law 100-594... this law states the sense of Congress that `it strongly encourages and supports the Amateur Radio Service and its emergency communications efforts; and Government agencies shall take into account the valuable contributions made by amateur radio operators when considering actions affecting the Amateur Radio Service.'
... (Continued next page)

ARRL COMMENTS IN NTIA SPECTRUM MANAGEMENT INQUIRY (Continued)

"In countless well-documented cases, Amateur Radio operators have stepped in to provide continuity of communications for government and non-government relief agents, as well as to the public, in disasters when normal communications links have been disrupted or completely severed. In such cases, the value of Amateur Radio is enormous relative to the amount of its allocated spectrum.

"The Amateur Radio Service, through participation by thousands of dedicated volunteers, provides a resource that could never be matched by commercial services. The very nature of the service requires that Amateur Radio operators be prohibited from accepting compensation for their communications services; however, this means they cannot afford to compete, head-to-head, with commercial interests that seek spectrum in order to provide services for monetary gain. A pure marketplace approach to spectrum management would work to the serious detriment of radio amateurs, and thus to the public interest.

"Thus, any alternatives to apportioning and valuing spectrum must take into consideration the following mandates:

1. Uses of radio that promote the safety of life and protection of property are entitled to special consideration.

2. Networks built and operated by volunteers that provide necessary services should be valued according to what it would cost to duplicate the services.

3. The value to the public of any particular communications service is not necessarily commensurate with the financial resources at its disposal; it is not in the public interest to apportion spectrum based solely or even largely on ability to pay.

4. The public is entitled to access to its own spectrum."

The League also commented on these issues:

- FCC allocation and assignment processes
- FCC reliance on private user groups for specific spectrum management functions
- Domestic coordination
- Strengths and weaknesses of existing domestic coordination process
- US preparation for ITU conferences
- The strengths and weaknesses of the block allocation system
- Possible amendment of definitions of radio services
- Increasing use of spectrum by non-licensed (Part 15) devices
- Revenue enhancement proposals
- Measuring spectrum use; private monitoring

ARRL concluded by saying, "As citizens who stand to be significantly affected by the policies adopted as a result of this proceeding, both as consumers of telecommunications services and as volunteer suppliers of such services, radio amateurs urge that those spectrum management practices which result in an artificial scarcity of spectrum be revised or replaced.

"However, in implementing new practices that encourage greater efficiency in the use of the radio spectrum, it must be recognized that they will have limited applicability to the Amateur Radio Service. Attempts to force-fit the Amateur Radio Service into a new system designed to encourage innovative uses of the spectrum will lead to the opposite result in one of the most innovative radio services now in existence."

FCC FORMS WARC-92 ADVISORY COMMITTEE

FCC Commissioner Sherrie Marshall and Francis Urbany, Director of International and Agency Relations, BellSouth Corporation have been appointed co-Chairpersons of the FCC's Advisory Committee for the World Administrative Radio Conference (WARC-92).

The Advisory Committee will counsel the Commission on the preparations for WARC-92 and will develop and make recommendations for the US proposals and positions on topics to be addressed at the conference.

ARRL Executive Vice President David Sumner, K1ZZ, has been named to serve as one of the 35 members of the FCC WARC Advisory Committee. Committee members were selected to represent a diversity of telecommunications interests and were drawn from both the business and the academic communities

FCC ISSUED CALL SIGN UPDATE

The following is a list of most recently issued FCC call signs (March 1).

DIST	GRP"A"	GRP"B"	GRP"C"	GRP"D"
	Extra	Advanced	Tech/Gen	Novice
0	WZ0Y	KF0IM	N0LPK	KB0GAM
1	WD1N	KC1TX	N1HJS	KA1VFZ
2	WW2Q	KE2SE	N2KJU	KB2JOW
3	NY3R	KD3RF	N3HWQ	KA3VVM
4	AB4TW	KN4EZ	N4YHA	KC4OVY
5	AA5QS	KI5DF	N5QBM	KB5LUZ
6	AA6UH	KK6HJ	N6YBR	KC6JCV
7	AA7DO	KG7AX	N7OIZ	KB7JVU
8	WZ8W	KF8ES	N8LXN	KB8JFB
9	WO9Z	KE9VF	N9JIN	KB9EDT
Guam	KH2M	AH2CF	KH2EI	WH2AMK
Hawaii	***	AH6KH	NH6WB	WH6CGU
Alaska	***	AL7LX	NL7TN	WL7BXE
USVI	NP2F	KP2BT	NP2DP	WP2AHA
P.R.	***	KP4QN	WP4XK	WP4IUH

*** indicates that all 2 x 1 call signs have been assigned in those areas.

The N-prefixed Group C (1X3) call# signs blocks for the fourth and sixth call districts have nearly all been assigned. After N4ZZZ and N6ZZZ have been issued, FCC will begin assigning calls from the Group D (2X3) call sign block.

OTHER FCC NEWS

Ervin S. Duggan was sworn in on February 28 as an FCC Commissioner by FCC Chairman Alfred C. Sikes. Commissioner Duggan succeeds former Commissioner Patricia Diaz Dennis. This brings the FCC to its full complement of 5 Commissioners.

An FCC Notice of Proposed Rule Making in PR Docket 90-100, released on March 7, proposes to relocate the Novice and Technician segment of the 80 meter band from 3700-3750 kHz to 3675-3725 kHz. The Commission believes that this relocation will reduce interference to and from Canadian amateurs. FCC is asking for comments with respect to the level of interference in the current Novice and Technician segment and how the proposed frequency move would impact current amateur operations. Amateurs may file comments on or before June 15, 1990, and reply comments on or before July 13, 1990.

Responding to an ARRL proposal (RM-6512), FCC has relocated automatic beacon operation in the 2 meter and 70 cm amateur bands (PR Docket 89-65). On 2

meters the band segment has changed from 144.05-144.06 MHz to 144.275-144.300 MHz and on 70 cm from 432.07-432.08 MHz to 432.300-432.400 MHz. ARRL also requested relocation of the 220 MHz beacon subband from 220.05-220.06 MHz to 220.275-220.300 MHz. FCC denied this portion of the request. Effective date of the change is May 18.

"NORTH POLE 90" EXPEDITION UNDERWAY

A joint UK/USSR expedition is underway with the two British members of the team attempting to reach the north pole on foot. The expedition "ice team" consists of Dr. Mike Stroud and Sir Randulph Fiennes. Their progress will be monitored from 2 base camps, one located towards the end of the expedition on the moving Arctic Ocean ice at approximately 86 degrees North Latitude and the other on Sredniy Island at the tip of the Soviet Union.

Two special event calls will be used. GB4MSS at Sredniy base camp and GB4ICE at the forward base camp on the ice. The main base station GB4MSS will be active during March with GB4ICE signing on in April. Both stations will be active on most HF frequencies. GB4MSS will also be active on OSCAR 10, OSCAR 13, RS10 and RS11. In addition, GB4MSS will upload weather and other information on the expedition to the Digital Communications experiment (DCE) on board UoSAT 2 (OSCAR 11). This information will then be made available on packet bulletin boards, worldwide.

Special QSL cards are available from the expedition's QSL manager Ian Crockford, GM1AUZ.

>write to get a catalog?

I believe there is still a Heathkit store near the Westminster Mall in
Westminster (metro Denver), Colorado - but most people wouldn't be interested
in that. I got a catalog about 6 months ago from Heathkit; heres the address
& phone number...

Heath Company
P.O. Box 1288
Benton Harbor, MI 49022

Orders: 1-800/253-0570, 24 hours a day.
(the catalog has several other phone numbers)

Hope this helps... -Robert

Lima,Peru.Date:17 March 1990.Time:1628UTC

Radio Club Peruano, OA4O is pleased to anounce that its EME Station
on 432MHZ started operations today receiving clearly the signals from
K2UYH and KB8ZW on CW at 1220UTC and 1240UTC. We had initially hward
our own echos. Tomorrow we will be transmitting withour 1.5KW
transmitter and 27 foot dish computer controlled. We have checked in
at the EME Net with K2UYH who is preparing the schedules for future
schedules.We would be most pleased to arrange schedules with all
those interested in working Lima,Peru on 432MHZ via the moon.

Our address:P.O.Box 538,Lima,Peru
.Phone[(5114)458134.Fax(5114)462408.BBS:OA4O,Node:Lima-1,

Frequency:28103kc.Forwading:N8GTC. EME Station:OA4O. Frequency 432,006MHZ.
Our next window:31 March 1800UTC to 0200UTC of April
1,1990.Regards.Alfonso,OA4PQ@OA4O.Lima.Peru.Sa.

>73's,
>++Brandon (pending receipt of my Novice ticket)

Congratulations, Brandon!

For those of you who don't know him, Brandon is one of the hardest workers on Usenet. He moderates comp.sources.misc, generally keeping the group's quality high and the content useful (even though he DID accept a submission from me! :-), and contributes thoughtful, cogent articles on a wide variety of other subjects. He's one of the most respected people on the net.

He took the time to learn code and get his ham ticket. That says good things about ham radio - someone who's that busy making the time to fulfill the requirements for a ham ticket says that he thinks he'd get something out of it, and wants it bad enough to do what's needed.

2023. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-04-01 18:39:04 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9004020604.AA12441@ucbvax.Berkeley.EDU>
Source record: 12578

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

2024. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1990-04-01 18:39:33 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9004020602.AA12330@ucbvax.Berkeley.EDU>
Source record: 12579

As a service to the satellite user community, the following description
of the NASA Prediction Bulletin's two-line orbital element set format is
uploaded to sci.space on a monthly basis. The most current orbital elements
from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513)
427-0674, and are updated several times weekly. Documentation and tracking
software are also available on this system. The Celestial RCP/M may be
accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop
bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical
to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

2026. Worthwhile non-amateur use of 902-928 Mhz

Newsgroup: rec.ham-radio
Date: 1990-04-01 21:50:23 UTC
From: karn@ka9q.bellcore.com
Message-ID: <21536@bellcore.bellcore.com>
Source record: 12595

The following item just appeared on the comp.protocols.tcp-ip newsgroup:

Article 11060 in comp.protocols.tcp-ip:
From: farber@linc.cis.upenn.edu (David Farber)
Subject: Re: High Schools on the Internet
Message-ID: <22608@netnews.upenn.edu>
Date: 1 Apr 90 14:16:53 GMT
Organization: University of Pennsylvania

We, at UPenn, are in the final stages of putting our
local magnet high school of engineering and
science -- the George Washington Carver High School
in Philadelphia onto the internet via
a spread spectrum radio link operating license free at
900 mh.

By the way, the GWC High School is an interesting case of
what can be done to turn the inner city
students onto science and education. They are really
an outstanding example.

Dave
David Farber; Prof. of CIS and EE, U of Penn, Philadelphia, PA 19104-6389 Tele: 215-898-9508(off); 215-274-8292 (home); FAX: 215-274-8192; Cellular: 302-740-1198 "The fundamental principle of science, the definition almost, is this: the sole test of the validity of any idea is experiment." -- R. P. Feynman

(end of included article)

At the risk of appearing to commit heresy and treason against amateur radio, I have to say that in my opinion this particular application represents a more worthwhile use of the 902-928 MHz band than yet another bunch of ham FM repeaters. And it is certainly far more worthwhile than letting the band go idle, which is its current state in most areas.

In my opinion, this operation ought to fall squarely within amateur radio's role in supporting education. I'd consider it a credit to the service if this operation were done under an amateur license.

The fact that so many hams see ham radio as an exclusive social club devoted primarily to the recreation of its aging members (and are determined to keep it that way) won't keep our bands from being used for other purposes. We can either enlarge the service to take in new and novel applications, or we can continue to wither as the FCC either reallocates spectrum outright to other services or increases the sharing in our bands, as with Part 15 spread spectrum on 902-928 MHz.

Phil

2027. We got a new Ham

Newsgroup: rec.ham-radio
Date: 1990-04-01 22:16:07 UTC
From: mikey@pnet01.cts.com
Message-ID: <2060@crash.cts.com>
Source record: 12597

I have'nt seen anyone announce the fact that a new ham exists. But it's true. I first became active on this very networking system here in Sandy Eggo after a long hiatus due to this individuals efforts. He has been active here and on the various Pnets for mucho time. He has faithfully (F)orwarded msgs to me that he knew would be of interest. I just got a near new Yaesu FT-33R walkie-talkie due to diligence in monitoring the various newsgroups. I would have missed this super-deal had I not had this extra set of eyes.

This individual is so interested that he has contacted the ARRL to check on what his call group may be. He has found an outfit that will sell the complete FCC Amatuer License Datafile on CD-ROM with supporting software for $50.00. He is toying with adding with the idea of having this database online for the rest of us to us (maybe with bi-monthly updates). Now that some interest I'd say.

Well, Mr. Scott O'Connell (scotto@ipars) passed his Novice test two weeks ago. And then passed the Tech yesterday. I now encourage him to keep practising the code while it's still fresh. Something I failed to do and have always regreated. Scott is now joining our local club and of course is anxiously waiting for his Novice ticket. He tells me he wants to start yappin' on the radio. Another lid hits the frequencies; oh well...

Congratuations to Scotto and welcome aboard.

2028. RF + Metal Siding = ?

Newsgroup: rec.ham-radio
Date: 1990-04-01 22:51:19 UTC
From: summers@hpspkla.spk.hp.com
Message-ID: <4630012@hpspkla.spk.hp.com>
Source record: 12581

I am considering having metal (steel) siding installed on my home and would be interested in hearing about any bad experiences anyone might have had with metal siding in a high RF environment (close to HF antennas). I am not worried so much about the effects of the siding on antenna impedance / radiation pattern, but more the possibility that corrosion could produce rectifying contacts which could generate harmonic energy.

Thanks in advance for any info.

Me:interested only in public service?") I would say two things. First, the
Me:amount of public service traffic carried by CW is nil; the action is on

Jim Grubs: OOOOOHH. You're gonna piss of the BPL folks! ;-)

Tell me about it. A few years ago, I was invited to one of my Division Director's cabinet meetings. The question of whether packet stations should be eligible for BPL credit came up. It was very telling to hear people argue against it because it was somehow "cheating" to be able to handle traffic reliably and quickly without an operator, and that it was "unfair" to those who still handled traffic via CW.

By the way, several people have challenged my use of the word "nil". I didn't use it to mean "zero", but rather "too small to be significant".

Phil

2030. Re: 49Mhz conversion question

Newsgroup: rec.ham-radio

From: jim@mmsac.UUCP
Message-ID: <5337@mmsac.UUCP>
Source record: 12582

I'm sure that you won't have to swap out the coils. If you only want to move them up .25 mhz, you probably won't even have to retune the coils. I'd imagine they are crystal-controlled, so all you'll probably have to do is order a new set of crystals from BOMAR (1-800-526-3935) for each unit, and you'll be off and running. The only problem I can forsee, is that they (BOMAR) will need the load capacitance across the xtal, and I don't know how you come up with that value. Perhaps the schematic will help. You'll also need the fundamental frequency of the crystal. They probably multiply it up to the 49 mHz range from some lower frequency. Again, the schematic should help. Calculating the rx xtal will be a little more difficult. You'll have to find out what freq. the IF is, and do a little mathematics. For example, if it is a 10.7 mHz IF, you'll subtract (or add, depending if you want high or low side injection) 10.7 from/to the desired operating frequency, then divide that result by whatever the multiplication factor is. If the existing xtals in the unit have their operating frequency listed on them, that will help a bunch.

2031. CALL FOR VOTES - rec.arts.tv.cable

Newsgroup: rec.ham-radio
Date: 1990-04-02 00:00:00 UTC
From: mrapple@quack.UUCP
Message-ID: <5233@quack.UUCP>
Source record: 12583
Cross-posted to: news.groups,rec.arts.tv,rec.ham-radio,rec.radio.shortwave,sci.electronics

[followups to news.groups. crossposted to s.e r.h-r for technical reasons,
r.r.s because of satellite discussions]

The first week of voting was both productive and unproductive. We
received 36 votes, and the ratio yes/no was 75%:25%. The bad news was
that we had a disk problem and lost them all. The vote won't be
extended, because those who voted in the first week have plenty
of time to do it again (my appologies), and it may or may not be
"legal" to do so anyway. Votes list (so far) below.

Lots also sent corrections for "satelite." Thanks. Really.

CHARTER: REC.ARTS.TV.CABLE

This group is for discussions pertaining in general to cable television,
and satellite television. Broadcast only issues should go to rec.arts.tv.
More specifically, discussions of technical, regulatory, programming,
and/or customer service/cost/quality issues are welcome.

Technical discussions of cable programming technology are welcome, which
is somewhat at odds to its placement in "rec," but this is proposed
simply because of the infeasability of placing the group elsewhere.
The original name rec.arts.tv.catv was objected to by several
because of the confusion over the designation "catv" meaning
community access TV instead of community antenna TV. Several have
objected to placing the group in rec.arts, but there have been no
alternative suggestions.

The newsgroups line would read:

rec.arts.tv.cable Discussion about cable and satellite television

This newsgroup would not be moderated. It distribution would be
world-wide.

To vote, send mail to:

uop.edu!quack!vote-no for no votes
uop.edu!quack!vote-yes for yes votes

A daemon will pick out the "From:" line and add it to a file. No reply
will be sent. Second call with vote list will be posted Tuesday the
2nd, and third call with vote list will be posted Tuesday the 9th.

The vote will end April 16, 2359 UTC, with the usual 5 day wait for
late mail.

Any personal mail may be sent to ...quack!mrapple, but votes sent there
will not be counted. Posted votes will not be counted.

Vote list as of 4/2/90, 0000 UTC:

From: Dave Ratcliffe <uop!uunet.UU.NET!compnect!dave>

2032. Cordless phone antennas question

Newsgroup: rec.ham-radio
Date: 1990-04-02 00:26:30 UTC
From: wlw2286@ultb.isc.rit.edu
Message-ID: <2640@ultb.isc.rit.edu>
Source record: 12584

I am interested in installing cordless phone antennas or the right length of wire in all the rooms of my house, so that I would get good coverage from room to room, and wouldn't have to put a phone in each room.

Does anyone have any good suggestions about how to go about doing this? Like the best antenna length and how to connect them all up to the receiver?

Lance

Any and ALL help is appreciated

I have to agree with Phil (not only because I'm involved in the project :-).

Although in many parts of the country 2m is overcrowded with repeaters,
simplex users, packet, etc., there is plenty of room on other bands, but
nobody seems to want to take advantage of it. Part of the blame should be
put on the manufacturers (e.g. Icom, Kenwood, Yaesu, etc.) for not
making equipment for these bands, particularly 902. But even if they
did, I'd guess that not many people would use them. Most people have
already found their own niche in ham-dom and don't care to change, which
is why 2m is still overpopulated while 220 is vacant in most areas,
even though range on 220 is virtually identical to 2m and equipment
is less expensive (many distributors/stores are selling 220 equipment
at a discount because it isn't selling).

By the way, as Phil mentioned, the data link is not amateur-radio specific
and does not require a license, even though it does operate within
the amateur band - it's a shared allocation. However, if a lot of people (read
businesses) see how useful the 902 band could be for both voice and
digital communications, especially at power levels higher than 1 watt which
is what the FCC limit is for this type of spread spectrum communications,
chances are that we'll lose the band completely and it will all be given/sold
to oranizations who WILL use it. But hey - we're not using it now, so

what's the big deal...

> some 250 Khz to the six meter phone band.
^^^-- 49.845 + 0.250 = 50.095 MHz (US phone band starts at 50.1 MHz)

AAAARRRGGH !!!!! You may well qualify for lid-of-the-year if you end up so low in the 6-meter band. All kidding aside, it is generally considered BAD PRACTICE to run even narrow FM below about 50.5 MHz; many would suggest a higher frequency. With so many people looking for band openings, which are fairly common these days, you would be MOST unpopular running FM (& ragchewing?) in the "DX window" at the bottom of the U.S. SSB portion of the phone band. There is a gentlemen's agreement to only work non-US/Canadian stations in the 50.100 - 50.125 MHz region, to make hearing the weak DX stations easier.

Good luck with your project.

I am looking for anyone who has had success in implementing a home-brew circuit for the Kenwood TM-x5x0 series of 144, 220, and 440 radios for the purpose of causing the radio to change frequency.

I am trying to design such a circuit that would use the DCL interconnection provided within this series of radios so that I could change the frequency of the radio remotely.

Is this possible? If someone out there has successfully accomplished this task I would really like to hear from them.

I will compile all responses and distribute as appropriate.

Thank you,
Steve Corso

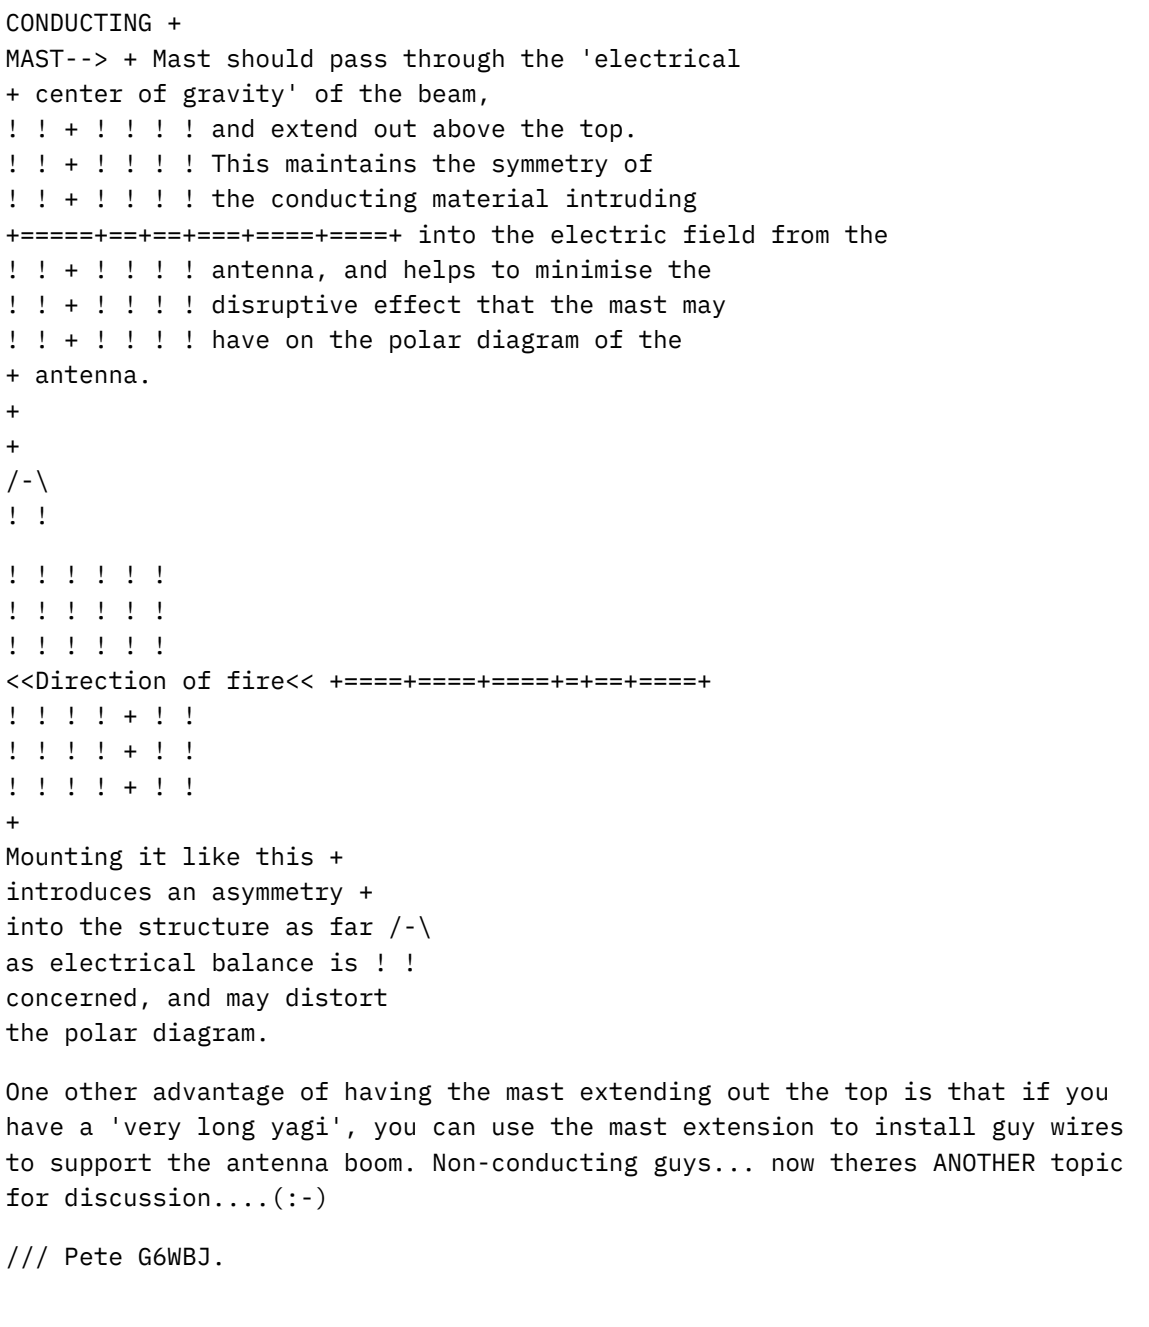
There was recent discussion about the need for non-conducting masts for vertically polarised antennas. IMHO this is not necessary. i have not done any serious research myself, just taken advice from the designers and installers of commercial VHF beams... (note i say *COMMERCIAL*, not *HAM* beams. The commercial guys dont get paid until the installation works.....)



CONDUCTING +
MAST--> + Mast should pass through the 'electrical
+ center of gravity' of the beam,
! ! + ! ! ! ! and extend out above the top.
! ! + ! ! ! ! This maintains the symmetry of
! ! + ! ! ! ! the conducting material intruding
+=====+==+==+===+====+====+ into the electric field from the
! ! + ! ! ! ! antenna, and helps to minimise the
! ! + ! ! ! ! disruptive effect that the mast may
! ! + ! ! ! ! have on the polar diagram of the
+ antenna.
+
+
/-\
! !
! ! ! ! ! !
! ! ! ! ! !
! ! ! ! ! !
<<Direction of fire<< +====+====+====+=+==+====+
! ! ! ! + ! !
! ! ! ! + ! !
! ! ! ! + ! !
+
Mounting it like this +
introduces an asymmetry +
into the structure as far /-\
as electrical balance is ! !
concerned, and may distort
the polar diagram.

One other advantage of having the mast extending out the top is that if you have a 'very long yagi', you can use the mast extension to install guy wires to support the antenna boom. Non-conducting guys... now theres ANOTHER topic for discussion....(:-)

2038. TH-75 Dualbander CPU Problems

Newsgroup: rec.ham-radio
Date: 1990-04-02 12:11:00 UTC
From: RHAREL%FAB8@SC.INTEL.COM
Message-ID: <9004030709.AA10427@ucbvax.Berkeley.EDU>
Source record: 12587

I've been experiencing several problems with my TH75 Dual-bander
HT ever since modifying the rig to work outside of it's
normal Amateur band limits. (Removed D-2 and W-1).
Every now and then the CPU will lock up during normal operation
and the radio will not allow transmit or change in any parameter
without first turning it off. Once I turn it on again - all
functions return to normal.
A less frequent, more severe problem is total reset of the CPU,
erasing all memory etc. - this also seems to happen out-of-the-blue.
Does anyone out there in Net-Land have any fixes for these problems
(besides buying Yeasu ...hi) or am I the only one who got the lemon.
I'd be happy to hear feedback.

By the way the HT allows TX from about 395-455 Mhz. Is there a way
I can bring up this window to the higher portion of UHF ?

Regards,
4X1DA
Richard Harel

2039. How does Novice upgrade in new proposal?

Newsgroup: rec.ham-radio
Date: 1990-04-02 12:59:39 UTC
From: dls@genrad.com
Message-ID: <34678@genrad.UUCP>
Source record: 12603

Forgive my ignorance, but I have waited around waiting to see if this was brought up and no one else has asked, so I'll ask.

I've finished reading the proposal that was in QST April 1990 magazine about the FCC proposal for the Communicator license. There is one thing that is not clear from that. I've asked a few local hams, and they've kind of hemmed and hawed over the answer as well, so I think it's a valid question.

With the new proposal, HOW DOES A NOVICE UPGRADE? It says that Novices will be grandfathered in....and Techs too, but upgrading from Tech is not the issue. In order for a Novice to upgrade, must he upgrade DIRECTLY to General? Does he take the 13 wpm Morse code test and then the General written test? What happened to the Technician test? Is that no longer required? (Before the older hams say that this is the SAME test, let me remind you that the PREVIOUS General test was broken into two separate question pools so that NOW the General test and the Technician test are two separate entities.) Is the Novice required to take the Communicator test BEFORE the General test?

Here are the options (and my conclusions) of what might be done (and I don't advocate any of these, I'm simply asking which one it is!):

1. The Novice must take the Communicator test, then the General test and of course the 13 wpm Morse code test.
Conclusion: The Novice must now memorize or remember not only the data for the previous Technician class, but also for the Novice class, which he has already passed. Plus, it is now a 60 question test, so he has to take 35 more questions than he would have had to take, were he to upgrade to Technician. A 60 question test may be overtiring for our younger hams.....

2. The Novice must only take the General test and the 13 wpm Morse code test.
Conclusion: The Novice surely gets a break here, since the NEW material which was previously required for Technician is no longer required. Stuff like repeaters, packet radio, 2meter protocol, simple calculations on series or parallel resistance, capacitance and inductance may never be learned.....

3. The Novice must take the Technician test, as before, then must take the General test and the 13 wpm Morse code test.
Conclusion: The Novice is basically provided the same means of upgrading as before. This does imply that the Technician test will be around as long as there are Novices in our midst, though....possibly a maintainability problem.

4. Other options? I can't think of any, but maybe I'm missing one.

Has anyone any idea what is meant by the current FCC proposal? I'd sure like to know.....since it looks like two of the Novices will be my kids (not yet, they passed the Morse code, but not the written yet!).

2040. Re: SW Radio Kit

Newsgroup: rec.ham-radio
Date: 1990-04-02 14:15:26 UTC
From: wmartin@STL-06SIMA.ARMY.MIL
Message-ID: <9004030705.AA10074@ucbvax.Berkeley.EDU>
Source record: 12588

Someone on one of these groups asked about a source for a shortwave radio kit. I just received a catalog from "Yeary Communications" which appears to be a source for parts for restoring old radios, radio books, and kits that include SW radios. Now, these aren't digital-readout and fancy-capability receivers; they are crystal sets, tube regenerative receivers, and simple minimal solid-state models. Prices range from $9.95 to $99.95 for the kits. They also sell some regular radios, scanners, and portable SW receivers.

Write for a catalog:

Yeary Communications
12922 Harbor Blvd., Suite 800
Garden Grove, CA 92640
[No phone given]

They also claim they'll "beat anyone's price" on radios, scanners, CBs, and some ham gear if you write for a quote. However, they don't seem to take chargecards (no mention of such on the order form) and their shipping charge seems quite high (12% of the order amount, $3 minimum) plus there is an extra $2 per-order "handling charge". They also sell used radio-related books and have separate flyers for those; if you are interested, ask to be sent the next issue when you write.

Regards, Will

2041. Code vs. No Code

Newsgroup: rec.ham-radio
Date: 1990-04-02 14:32:00 UTC
From: GOODWIN@SMCVAX.BITNET
Message-ID: <9004030707.AA10230@ucbvax.Berkeley.EDU>
Source record: 12589

As a newly-licensed Novice (still waiting for a call sign!), I thought a perspective from that point of view might be interesting. I should point out that I am not intimately familiar with all the issues surrounding this debate, so I'm sure I'll miss some points which might be obvious to the rest of you! :^)

I think most everyone would concede that the population of hams today is in decline. Reasons for this may not be so easily accepted though. It appears to me to be due to several factors. First, radio no longer holds the challenge and mystique it used to. Second, there seems to be little in the way of interesting discussion on the bands. One can only listen to so many rig and weather reports, after all. Finally, although it may not be difficult to learn code, many people undoubtedly find it no longer worth the effort and hence remain unlicensed.

I do not believe that code should be an entry-level requirement; it serves too much as a deterrent in this day and age. I would like to see it retained as an incentive of some sort for those who wish to learn it; perhaps by granting some additional frequency privileges to those who do so. To that end, I think we need a no-code license that grants a smattering of all operating modes and bands. This will allow a new ham to get his or her feet wet and see what else is happening outside their allocations. A VHF only no-code won't do that.

By judiciously allocating spectrum, I think the FCC could provide the incentive to upgrade. As a simple example, give the entry-level licensee some privs on 10 meters. They'll be happy until the band dies at the pit of the solar cycle, at which point upgrading will probably become very interesting to them. Of course, code would be a requirement for that upgrade but they don't HAVE TO upgrade. It's their choice.

I don't agree with the viewpoint that code should be eliminated entirely. There are still many occasions where it's useful. An advanced ham should know it, in my opinion.

As a final comment, let me say that I think the current testing system is a joke. Those who espouse simply adding more questions to the test are doing themselves and ham radio a disservice. These question pools are simplistic and require almost no knowledge of the underlying technical concepts to answer. I was amazed to find out that all the questions and answers are readily available! What kind of learning does this encourage? I strongly feel we need a testing process which ensures that licensees know something about what they're doing! We need to avoid the "appliance" syndrome.

Well, that's my perspective. Comments and/or flames are welcome! I have asbestos skin! :^)

>if he doesn't know how to respond to real-world questions like
>"You are given ten pounds of brocolli and asked to give equal portions to 25
>people, except for George, who isn't eating any. How much should you give to
>each person?"

Obviously, you give each broccoli-eater 3 cooked stalks (sprigs?
whatever you call the individual pieces after you cut up the bunches...)
and let the ones who want more come back for seconds. :-) [You said it
was a "real-world question"; this is a real-world answer from a cook...]

Regarding the math/calculator issue, it is an interesting phenomenon. I
grew up in the pre-calculator age, so learned traditional arithmetic in
school. Yet now, though I am perfectly capable of adding in my head and
doing computations on paper, I *don't trust myself* any more. I feel a
compulsion to get out a calculator to do simple things like subtracting
the check amount from the balance in my checkbook. To relate this to ham
radio, I wonder if the same attitude arises once you get used to digital
readouts? The old dial-scale interpolation skills might still be there,
but you feel "better" or at least more comfortable with an explicit
digital display telling you what you already knew.

Maybe it is due to the accumulated memory of errors made in the past from
carelessness or sloppiness or whatever, but more and more you feel the need
for the confirmation or reassurance those little glowing digits provide...

It seems like it has been for *years* that we have been reading the
following statement, over and over, in the DX news:

FROM THE DXCC DESK. DO NOT SUBMIT QSL CARDS FOR WALVIS BAY BEFORE
JUNE 1. CARDS SUBMITTED BEFORE THAT DATE WILL BE RETURNED WITH NO
CREDIT. DXCC CREDIT FOR WALVIS BAY WILL BE GIVEN FOR CONTACTS ON OR
AFTER SEPTEMBER 1, 1977.

What IS all this anyway? If the contacts are legitimate, what makes them
invalid or incorrect until the "magic date" of June 1? If the spot has
been a "real" "DX country" since 1977, let the contesters or certificate
hunters claim the damn thing. It certainly hasn't been worth using the
prime position at the start of this DX news posting every issue to put this
notice about "no, not yet...", especially when there doesn't seem to be
any reason *not* to accept the silly cards whenever they are submitted
in any case. Is this the result of some sort of political infighting or
personality conflict? Somebody retiring as of June 1 or something?

I guess I just finally read this thing one time too many... Maybe it
wouldn't have been so irritating if it had been a footnote or an
addendum instead of the #1 item each issue....

The old curmudgeon,
Will

I tried to mail this, but the poster gives too-abbreviated a net address in his signature and the return-path failed. So this is directed to Jack Schmidling:

How about a posting (at least to the swl list) explaining just what the ARF is, and a bit of its history? I'm sure a lot of non-hams out here, like myself, have no idea what it is and why it exists.

Also, I note the dates you give are Thursdays, but the signature block indicates airings on both Tursdays and Saturdays. Is the Saturday one a tape repeat? Are the times unchanged after the start of Daylight Time?

2046. Amateur Radio is Enjoyable!

Newsgroup: rec.ham-radio
Date: 1990-04-02 15:40:27 UTC
From: rbono@necis.UUCP
Message-ID: <1223@necis.UUCP>
Source record: 12604

.
.
.
[Seeing how many potential Amateur Radio operators subscribe to this (rec.ham-radio) forum, I believe that we (the users of rec.ham-radio) should try and spend at least a little net-bandwidth talking about the enjoyable aspects of "ham" radio. It seems that (some of us) don't realize that this method of communications is very much like Amateur Radio in that this is an INTERNATIONAL forum. With this in mind, let me relate a recent enjoyable on-the-air experience and challenge others to do the same:]
.
.
.
I frequent the 10 meter band, and usually have my radio tuned to 28.330MHz when not using it for anything else. One Saturday while working on a project in my 'shack' I heard a signal a little off this frequency and tuned the radio to get clearer reception. As I tuned the signal I heard a young voice. As the voice became clear, I heard the person saying 'CQ CQ this is KA0xxx' (CQ means 'calling anybody'. Sorry I don't have my log in front of me, I can't remember the actual callsign). I answered the call, 'KA0xxx this is NM1D in New Hampshire'.

We chatted for 20 minutes or so. Her name was Theresa. She was about 16 years old and was at her grandfather's home. She goes there to use his shack because she does not have a shack of her own. She has a job now, and hopes to save enough money to purchase her own radio equipment.

As we chatted, we learned a little about one another. When she is not using 'ham' radio she enjoys walking. She frequently follows the train tracks with her friends, and enjoys the country side. I told her that I also enjoyed walking along the train tracks when I was a kid (I am 32 now), and my friends and I used to walk for long distances along the tracks.

I mentioned how the countryside here in New Hampshire is... many hills, and less than an hour from Boston, the White Mountains, and the Ocean. I told her that I also enjoy SCUBA diving here in New England in addition to my Amateur Radio activities.

This started a discussion about swimming and water in general. Being in the mid-west, she has never been to the ocean. Although her area has some lakes and ponds, the only 'large' body of water is the Missouri (sp?) river. She couldn't imagine swimming in the ocean because she imagined it must have a swift current like the river!!! I explained that the ocean does have some currents, but most beaches (in my area) are very 'swimmable', with a light to medium surf that makes the ocean a fun place to swim.

It was very enjoyable to 'travel' through her eyes to the midwest. I believe that she now has a better idea of how it is here in Southern New Hampshire. I am sorry to say that we had to end our conversation early (her dinner was ready), and I am looking forward to chatting with her again.

Amateur Radio IS very enjoyable, share it!!

>people CANNOT learn math.
>
> AA6KX

As rebuttal, I need only offer an existence proof. I know a guy with self-described "code dyxlexia". Had a hell of a time hearing CW. He claims his VE "gave" him 5 wpm (!). Because of this, I can't tell you who it is. This same guy happens to have been a microwave wiz at HP back in the early 70's when hams were just getting their feet wet above 1 GHz. I often wonder what might have happened to our hobby had he gotten in 20 years ago.

When constructing a test as a means of filtering "undesirables", it is important to be testing the right thing. However, your point about the quick-to-whine is well-taken. It is my opinion that a CW requirement isn't what you want if you're trying to promote a technical hobby.

All this code-vs-nocode debate is putting the cart before the horse. We should first decide what ham radio is (should be), and then develop a testing method to achieve that goal.

From: mmm@cup.portal.com
Message-ID: <28533@cup.portal.com>
Source record: 12594
Cross-posted to: sci.electronics,rec.ham-radio

I had thought that Litz wire was the stuff used for the cords of old-fashioned headphones, mostly because it was limp. Is this true? Is that difficult-to-solder stuff used for cheap earphones Litz wire?

BTW, I recently went looking for a crystal earphone for a project which needed a high-efficiency, high-impedance audio output. Surprise! Nobody makes those anymore. They're impossible to find. The guy at Halted didn't even know what I was talking about. I finally found one among the accessories for a 30-year-old Sony reel-to-reel tape recorder my dad has.

I guess that means kids won't be able to build simple crystal radios anymore :-(

Radio Shack had little earphones, but when I cracked one open, I found a little coil. Impedance was probably between 8 and 32 ohms. The leads seemed like what I have always called "Litz wire", i.e. tiny threads of copper woven with some kind of fiber.

Try (800) 253-0570. Visa, Mastercard, and American Express.

It sure looks like the beancounters have gotten to Heath. Half the stuff
in the catalog is only available assembled, and the retail stores (actually
a seperate corporation to dodge the state sales taxes) seem to be mutating into
Apple Computer dealerships. The local store is even closed Saturdays.

On the plus side, they're back in the hi-fi stereo kit buisness.

Now that Bull is buying the Zenith Computer division, who got Heath?
Bull or Zenith?

> these days, anyway?), I've received numerous replys. Here is my thumbnail
> summary:
> [Others omitted]
> 73: Low-tech, appliance operator oriented

As a reality check, I located a nearby newsstand that carries QST, QEX, Ham-Radio, and 73 magazines. I then invested this week's lunch money and bought them all (and the latest Scientific American, for the review of Currents_of_Death). After skimming them, I came to the conclusion that, at least for this month, 73 was the most interesting (even technically).

The articles ranged from analysis of the state-of-the-hobby, through discussons of fairly high-end technical operating practice, and even included some low-to-medium tech construction articles. Hardly the technical oasis I'm searching for, but better than the other offerings this month (Ham_Radio wasn't too horrible, either).

Still carrying my lantern...

2052. Technical question on RF power measurements

Newsgroup: rec.ham-radio
Date: 1990-04-02 22:30:27 UTC
From: gary@tank.uchicago.edu
Message-ID: <8230@tank.uchicago.edu>
Source record: 12606

Excuse my intrusion into this ham group but I think this is the best
place to get my technical question answered.

RF input power; RF output power;

I was looking at a bunch of specs for (can I say this here) "CB" radios.
The specs give numbers for RF input and RF output power.

So here's the question(s).

1) At what points are these values measured and by what mechanism?

2) On 3 different radios(transmitters) I see the following:
a) RF Input- 5 Watts; RF Output 4 Watts
b) RF Input- 5 Watts; RF Output 3.5 Watts
c) RF Input- 5 Watts; RF Output 2.5 Watts

These radions are all advertised as being "5 Watts" but I
assume that this isn't the "bottom" line as far as what
you get as realized power

What's in the last stage ? Is RF output power rating related
to type of antenna configuration (I assume that if I knew how
these are measued I know the answer to that - but I don't.

Can someone clear thus up for me ?

Thanks,
Gary

I agree heartily. And when they get their new ham tickets (either code or
no-code variety), they can tack on amps and boost their range. Hurrah for them!

Several years ago, there was a devastating tornado at Xenia, Ohio.
(Pronounced "ZEENya".) The Amateur Radio Emergency Corps (later AREService)
did fantastic work in the disaster. The work in that immediate locality was
done primarily on VHF FM repeaters.

Later, one of the radio clubs in Toledo brought some of the people involved
to Toledo to lecture us what they had learned about disaster
communications. During the Q&A period that followed one of them remarked
that at a similar Q&A session in another Ohio town he was asked by an old
timer, "Why did you use that two meter stuff? You could have done the job
just as well on 80 meters."

A little further probing revealed that the OT had never operated anything
but HF CW and literally was incapable of comprehending the need or interest
in anything else. I think much the same mentality is operating in the case
of much of the anti-packet and anti-no-code sentiment. They're not "bad"
people. They just don't comprehend what it is we're trying to do.

"INFINITESIMAL" might have been a better choice.

2055. HF beacons on satellites

Newsgroup: rec.ham-radio
Date: 1990-04-03 00:51:04 UTC
From: mahaun@sactoh0.UUCP
Message-ID: <2804@sactoh0.UUCP>
Source record: 12610
Cross-posted to: rec.ham-radio,rec.radio.shortwave,sci.space

Does anyone know of any currently transmitting satellite beacons in the range of 10-30 Mhz? These beacons are really fun to listen to on an HF general-coverage receiver because you can listen to the obvious "falling tone" doppler effects. The are also useful in ionospheric studies because they will bounce back into space if the MUF of the ionosphere is above their transmitting frequency. Sometimes one can actually listen to the spacecraft as it passes "holes" in the ionosphere, and often its signal will propagate hundreds of miles through normal HF propagation after entering through one of these holes.

Several months ago, I knew of two such satellites: UoSat-OSCAR 9, an amateur radio satellite, carried propagation beacons on most of the HF amateur bands, but it reentered last year. The Soviet Mir space station used to have a beacon on about 19.954 MHz, but I haven't heard it for quite some time. Perhaps it has a new frequency?

I would appreciate hearing from anyone who has successfully monitored any such satellites. If I get enough of a response, I will post a compiled list of them.

Thanks,

Try the Soviet Radiosport satellites, RS-10/11. (Actually, one
satellite with two transponders. I don't know which one is
active right now.) Their beacons are on 29.403 and 29.453.

For those who've never tried this before, you can determine when
they'll pass over your location by using tracking software in
conjunction with the Keplerian elements that Tom Kelso posts to
rec.ham-radio (and sci.space?) every week or so.

Really? I thought it was only on VHF. If it was on HF, maybe its
sister satellite, UO-11, is on HF as well.

Wyman Research, Inc.
R.R. #1, Box 95
Waldron, IN 46182

317-525-6542

A very small operation, Wyman uses Wood and Douglas components and
builds various units around them. I've used their gear for
mobile robot video. Wyman sells FM TV gear, which has good noise
immunity, although hams may find it difficult to find someone to
talk to.

Video linearity and audio bandwidth are both poor by broadcast
standards. But compared to typical AM ATV, it's great.

ANOTHER APPLICANT SEEKS FCC
APPROVAL FOR PCN EXPERIMENT

STATUS: Another entity in a growing list of wireless afficionados has filed an application with the FCC for an experimental license to provide personal communications network service (PCN).

PCN, a currently undefined and untested method of wireless communication, has caught the interest of numerous companies and individuals throughout the U.S., Europe and Japan.

The latest American attempt to experiment with PCN was filed by Matrix Personal Communications, Inc. Matrix proposes to provide a low-powered voice and data system for ten handsets in the Chicago area. In a second phase, the proposal calls for expansion to 100 handsets.

COMMENTS: The FCC is aware of the growing interest in wireless communications, as evidenced by the increasing numbers of PCN-related and CT2-related experimental applications.

FCC staffers are preparing a notice of inquiry, requesting additional information about wireless communications and the potential need for spectrum. Meanwhile, it's expected that the FCC will continue granting experimental licenses to applicants whose proposals are relatively small and are not likely to interfere with existing users. Larger proposals, like the recent Millicom filing, may be held in abeyance pending Commission action on the notice of inquiry.

THE NEW YORK TIMES, 3/27.

PHILIPS TO BUILD TV TUBE PLANT, p.D5.
"Detroit, March 26-The Philips Display Components Company said it would build a $100 million color-television picture-tube plant in Saline, Mich. The plant, which could eventually produce high-definition television picture tubes, is scheduled to begin operating in July 1992. Plans call for the production of a million 27-inch color-television picture tubes a year."

SPEAK FOR YOUR DAMN SELVES!!! It just so happens that in Jeff's part
of the country is probably THE most active group on 902- namely, the
Mt. Airy Pack-Rats. I'll bet no one bothered to ask them- specifically
WA3AXV, N3CX, WA3NUF, WC2K, WA3JUF, WB3JYO or the other officers of the
club about their opinion regarding this subject. The impact of 1 Watt
license-free equipment is already being felt on this band- the wireless
stereo speakers that are now available immediately come to mind. There

is a fairly large, but mostly unsung group of weak signal operators using the 33cm band all over the Northeastern U.S.- you don't hear much from us because we mostly are building stuff and running skeds, and because we're not all over the band. If the feeling is that we need to do something to save the band (and I don't disagree with that feeling), at least have the courtesy to save a small portion, say the bottom few hundred kiloHertz for those of us that pioneered the band. That way we can continue to experiment with useless modes such as CW and EME :^)- and- oh yeah, so we can demonstrate that we can reliably communicate over distances of hundreds of miles with low power and on a band where the expected range of communications is in the tens of miles.

There- I feel better now.

Flames to /dev/null- so there.

Heck, I wouldn't worry too much about 902-928 being turned over to commercial services anytime soon. Not so long as its primary occupant is the ISM service!

It's a garbage band, given to hams because hams won't interfere with rf heaters. :-) Now if the spread-spectrum data were able to get thru the crud, and there were little enough crud that the rf-modem vendors didn't get overwhelmed with complaints, then maybe...

Incidentally I just received the latest edition of Mischa Schwartz' book on modulation and noise. It has all sorts of useful information about modulation, coding, etc., albeit a bit too mathematical for my taste.

UO-11 does not have an HF beacon. I heard several of the HF beacons on
UO-9. It was a shame that more was not done with the beacons. I think
the University of Surrey program is just outstanding, packing a lot of
neat stuff into their birds on a shoestring budget. My only complaint
with them is their `on orbit support' of a user community which could be
a lot bigger if kept better informed. I could never find out what beacon
was going to be on when and found it frustrating. This has gotten much
better with UO-11 running DIARY and Jeff Ward's arrival at Surrey.

> figures, like almost maximum gain with a clean pattern?
>
> Ken Hendrickson N8DGN/6 kjh@usc.edu ...!uunet!usc!pollux!kjh

There are a number of ways one could approach the Yagi stacking problem:

1. Use a generally accepted "rule of thumb"; these usually provide resonable
results.

For stacking Yagi-Uda arrays, the one wavelength distance does provide
maximum gain. For extended Yagi's (i.e. very long), another rule of
thumb is to stack a distance equal to 3/4 the length of the boom of
the antenna.

Since the requirements stated "maximum gain" without any mention
of pattern requirements, the rule of thumb stated above should
provide reasonable results for the given application.

2. Use the results published in the literature:

If it is desired to go into further detail and optimize the stacking
distance, I'd recommend reading the U.S. department of Commerce/National
Bureau of Standards publication "Yagi Antenna Design", NBS Technical Note 688
author P.P. Viezbicke, December 1968. This publication gives criteria
for Yagi design and stacking.

Another paper I'd recommend is C.C. Lee and L.C. Shen, "Coupled Yagi
Arrays", in the IEEE Transactions on Antennas and Propagation,
vol. AP-25, p. 889-891, November 1977.

3. Experiment with various distances

You could also experiment with distances around those given by the
rule of thumb, and measure both the gain and the pattern in the far field.
This does require antenna pattern test equipment.

The considerations such as front-to-back ratio, front-to-side ratio, gain, etc.
are both a function of the design of the Yagi itself, and also how the Yagi's

are stacked. If the requirements are strict for these parameters, then an in depth analysis would have to be performed.

> The only MFJ product I own is an HF dummy load. It's been 100% reliable. :-)

When Dennis ve7tcp and I were fiddling with his new hf rig, we started by making a few patch cables & c (using those *atrocious* pl-239s you get from radio scrap). I got to build the cables because I'm the only one who knows which end of the iron to pick up :-). Anyway, we hooked the new rig to Dennis' new MFJ dummy load and keyed up - suprise! It wouldn't load. Naturally I was the goat and suspicion centered on the cables I had just built. (Some present questioned the quality of the beer.)

To make a long story short (or rather open) the real problem was that MFJ hadn't bothered to scrape the paint from the case of the dummy load in a couple of strategic places, and we were tring to drive about 500 K ohms or so instead of 50. So even a dummy load can have problems.

Yes, I own some MFJ gear too. I think it's OK for the price.

On April 7, 1990, at Worcester Polytechnic Institute
in Worcester, Massachusetts, the WPI Wireless Association
will be holding The Second Annual Open House in its Ham Shack.
It will run from 10:00 AM to 4:00 PM. We will be working
on many bands (160m - 10m, 2m, 440MHz, as propagation permits),
and in many modes. The Club Station, W1YK, is excellently
situated on the roof of Salisbury Laboratories, which is one
of the buildings on the top of a large hill where WPI is located.

The WPI Wireless Association, founded in 1909, is the oldest college
radio club in the United States. Originally 1YK, the station and
club has enjoyed a wide variety of equipment and opportunites, including
a 440 MHz repeater and a satellite tranciever station.

Come and help us celebrate our 81st Anniversary!

For more information, send mail to me (see signature), or any of the
people you hear working as W1YK.

That's Quorum Communications, Inc.
P.O. Box 277
Grapevine, Tx 76051

Phone # (817) 488-4861

It's run by my good friend Rick Fogle, WA5TNY- tell him I said
hello.

Rick has been working on this product line for a while now, and
with the cooperation of several other noted VHF/UHF/SHF types
(WB5LUA and Bill Olson W3HQT/1 of Down East Microwave), has developed
what is probably the finest WEFAX line available.

If you're going to the Dayton Hamvention, Quorum will have a booth
right next to (actually part of) the Down East Microwave booth. Stop
by and talk to Rick, Bill, John WA3ETD (SHF Systems, makers of the
single-board no-tune transverters), Rick KK7B, Jim WA8NLC, Al WB5LUA,
and last and certainly least, me. I suspect Quorum will have hardware
to demo and sell there.

Hope this helps.

Message-ID: <9004031956.AD00051@rtp40.dg.com>
Source record: 12617

COMMENTS ON ARRL FILE FORMAT FOR CONTEST LOGS

This is a response to K1CC's posting:
First, the philosophical objections. I am not a big gun and I have never spent the full contest period on the air. I typically work 300-600 stations in a contest. I have won the EMA section from time to time mainly due to weak competition.

All of my logs are kept by computer using software that I have written. I have no problem formatting a floppy in the format that you request. My question is why should I bother? It might take me a day to write the code and I would have to copy the files off my UNIX system onto an IBM PC to write the floppy. All for zero gain. And I don't even get the floppy back. Why should I go to that bother instead of just printing a log on my laser printer?

To attempt to answer my own question, there are several things that would motivate me to send in an electronic log and even pay for the chance to do it. First, if it were required for stations with over say 500 QSOs. This might cut down the competition. A more positive reason would be getting an audited log back. I would be happy to pay $10 to $20 to get back a floppy with my cross checked QSOs. A simple flagging of unique QSOs would be of value.

In short, I need some better reason than making a contribution to the ARRL's supply of floppy disks.

Now for the technical issues. First, you say, "aligned by column", what does that mean? I assume that you mean in fixed width columns padded (on the right or left?) with ASCII blanks and with a single blank between columns. How about a comma between columns?

Under "CALL" you say, "(allow 15 columns)". There is no specification for the number of columns for any other data item. Can I pad the others to 50 characters each? How about 512 each? Why should the call be longer than the largest station that I work? Should numbers be padded with zeros and right justified?

The statement "Complete exchange sent" and "Complete exchange rcvd" is not very specific. What about contest like SS where there are long exchanges? Should there be blanks in this column making it, in effect, multiple columns or do you want something like 123BWB2UMF65EMA as one hunk?

While there may be a few popular logging programs that many people will use, some of us will want to roll our own. You need to specify EXACTLY what the ARRL will and will not accept. I have been

writing software for 30 years and the single largest cause of problems
is lack of a clear statement of what is wanted. Do not assume that
the world of amateur programmers out there will know what you mean.

>
>Heck, I wouldn't worry too much about 902-928 being turned over to
>commercial services anytime soon. Not so long as its primary occupant
>is the ISM service!

Good theory...but ISM isn't the ONLY primary on the band....I believe
another primary is a mobile location service (or something like that...)
Everyone down in the LA area has thrown up their hands in recent months
because a commercial system is to be installed in the next couple years
using something like 7Mhz of the bottom end of the band.

Anybody have better/more accurate details of this?

All of the propossed ARRL band plans are out the window right now
because of this system. Since this other service is primary..
amateur repeater interference won't be tolerated. I also believe
this same company is planning on installing similar systems in most
of the major metropolitan areas over the next 4-6 years.

2074. Foreign Language Translators

Newsgroup: rec.ham-radio
Date: 1990-04-03 22:01:21 UTC
From: griest@ajpo.sei.cmu.edu
Message-ID: <659@ajpo.sei.cmu.edu>
Source record: 12384

Forgive me if I am restating or missing something... I am new to
this newsgroup and to Amateur Radio.

It seems to me that amateur international communication could be served
by the availability of a public-domain translation system for use with
PC-based communication systems. I realize that natural language translation
is not a perfect technology, but for people who use Morse code,
perfection is obviously not a big consideration.

Do any such systems exist? I have heard of hand-held translators which I
suspect are moderately useful for foreign travelers. The draw-backs
in these systems is the requirement to carry around the notebook sized
machine, and the cumbersome typing-in/reading of the text. These are
not an issue for RTTY-type communication systems.

The system I envision is one that provides both the original text on one
line and translation(s) under it. A really dumb system would just look
up all possible meanings of the source words and display them under
the original text. A more sophisticated system would work on phrases,
or even use some AI techniques to translate semantics. Since this
is not intended for business or diplomatic uses, occasional errors
are probably acceptable. I would imagine that for simple systems,
real-time translation should be feasible.

Anyone know of the availability of such a system? Or is anyone interested
on helping with the development of such a system?

I live in a 2nd floor apartment without a balcony, and am trying to get onto HF bands of 20, 40 and 80(!) meters. Have been loading up eight feet of wire using a commercial antenna tuner with poor transmission results, and with the effect that the room lights get brighter on 20 meters, and I get moderate herringbone cable-TV interference on 40 and 80 when loading at full power of one hundred watts output. Currently, I am wondering whether loading up a horizontal loop would result in less local interference and more radiated power. Does anybody have any experience or suggestions?

On a semi-regular basis I see both requests and answers to questions for scanner modifications. Rather than have to search and repost this information each time id like to offer to collect this information into one file. Then this file could be place at a site that offers a mail server (you send a request via mail and the list is forwarded to your account). To do this I would require 2 things, (1) a site with such a mailer that is willing to keep this list, (2) YOU to send me your list of scanner modifications.

Rest assured I have no plans on converting this information into a book or magazine article. That all credits (if attached) will be maintained. My only goal is to make life easier for those who want to know and as such im willing to donate the time to prepare and maintain (update) a list.

Comments, questions, offers for a mail server....

2077. Re: Amateur Radio is Enjoyable!

Newsgroup: rec.ham-radio
Date: 1990-04-03 23:59:07 UTC
From: allbery@NCoast.ORG
Message-ID: <1990Apr3.235907.6231@NCoast.ORG>
Source record: 12623

As quoted from <1223@necis.UUCP> by rbono@necis.UUCP (Rich Bono):
+---------------
| Amateur Radio IS very enjoyable, share it!!
+---------------

Undoubtedly. Unfortunately, I'm currently finding the *physical* requirements to be a bear....

To wit: I live in an apartment, on the ground floor. Putting up an antenna down here would seem inadviseable, the landlord doesn't like antennas hanging from e.g. the patio of the apartment above mine, and even if I'm allowed to put an antenna on the roof, I'm none too keen on climbing around up there. So I've scratched working from my apartment for now.

My next thought was, of course, mobile. Ever try to fit a radio---ham, CB, or otherwise, aside from in-dashboard models---into a Ford Escort? It doesn't look too promising, unless there's one that will fit into the dashboard. So far, the only radio I've been able to see up close is the Radio Shack HTX-100; it won't fit. About the only place I can see to put it is somewhere where it will be virtually begging for someone to break in and steal it---and I sometimes have to go to parts of town where having something that visible is a *very* bad idea. An alternative would be to stuff it in the glove compartment---my father did that back when he had a CB, and even had a special mount for it so that the radio could be seen and tuned within the glove compartment---but, again, it won't fit.

I seem to be stuck with a handheld. Do 10 meter HT's exist? (Until I upgrade, I'm rather limited in voice bands---and I don't want to try to operate CW while I'm driving....) I don't want to jump into 220 only to have it mostly disappear, and while 1270-1295 looks interesting, I'd like to also have a presense on bands which have a somewhat better chance of reaching non-local stations.

So I'm looking for suggestions. (Aside from "upgrade"---I'm working on it, but I suspect that I'll be able to get on the air before a test date coincides with my schedule.)

>bill KB3YV

From time to time they have a shot of the "ham shack" (garage) and Willie's
call is something like KXY913 or something along those lines. It is not a
real call, although it was nice of the producers to have taken the time to use
real hams gear. Along the same lines, I was watching Die Hard (starring the
guy from Moonlighting...the name escapes me) and they were using either Ken-
wood TS41's or 21's for their communications. Funny thing, how did he know
what frequency the cops used in LA? He was from New York. And wasn't it
convenient that it was already dialed in? :)

From: edeu5eb@OUTLAW.UWYO.EDU
Message-ID: <900403190854.208004ea@UWYO.BITNET>
Source record: 12393

I have a Kenwood 721 radio and have been wanting to interface this to my repeater to provide a simplex I/O. I want to be able to control various functions of the radio, basically those available on the RC-10 remote handset.

All of the functions from the RC-10 are controlled through the microphone plug. I am wondering if anyone has the communications protocol from the RC-10 to the microphone plug.

I called Kenwood in California today and talked to their technical support. I was told that they didn't have the information but had "heard that some hams had received this information directly from Tokyo but it would take awhile to get a response".

Before writing to Tokyo, I decided to see if anyone on the net had this information. Any help would be greatly appreciated.

Thanks

2082. Reference wanted for systems that Design Analog Circuitry

Newsgroup: rec.ham-radio
Date: 1990-04-04 02:48:05 UTC
From: GMoretti@massey.ac.nz
Message-ID: <661@massey.ac.nz>
Source record: 12386

WHAT
I am interested in finding out what work has been done on expert systems
or CAD systems for the DESIGN and SYNTHESIS of DISCRETE ANALOG circuitry.

I'm lookin
g for references to work that encompasses the synthesis of
systems (eg radio receivers) down to building these at the component
level (such as coils transistors, opamps ...). I'm looking at systems
that help you to design such system, not ones that help you optimise IC
layouts ...

WHY
This area is inspired by my constant irritation whenever I want to design
anything of having to wade through all the books I used last time (when I
can remember what books they were) to find out how many turns you need on
a toroid for a certain inductance or any of the other myriad of standard
formulae/approximations that we all use when designing something, but not
often enough to commit to memory.

STORING CIRCUIT IDEAS
A related part of this is the need to store all the neat circuits/ideas
one finds in magazines ... in such a way that it's usable by the
synthesiser. I've got a pile of articles about three feet high that I've
copied from magazines, great information in there - if you can find it.

HOW ???
If you know of any work in this area, I'd like to here from you,
especially if you have references :-) If you have any ideas or constant
source of annoyance that you think a system like this should address let
me know.

Thanks
Giovanni ZL2BOI

I THINK the formula for Drake 4-line crystals is:

F(crystal) = F(low end of band) + 11.1 MHz

The 11.1 number is what I'm not sure of. Check one or two of the other crystals to see if this is the right number.

To all you folks who are so burned up by this guy - why don't you get in touch with W1MFJ, W2MFJ, W3MFJ and all the other MFJ calls you can find, and line them up in the next contest and work BB one by one. It would be fun to listen to.

More realistic is to take AD1C's advice and ignore him. There are usually V3's on in major contests and at other times. Most of them have US QSL managers and you don't have to suffer through what many of you apparently have. There are a few countries that have only one active ham most of the time, and you have to work that person if you want a QSL card, but Belize isn't one of them!

2086. HF Transceiver to drive transverter.

Newsgroup: rec.ham-radio
Date: 1990-04-04 10:02:25 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <04.Apr.90.11
Source record: 12626

Anyone out in netland got any advice on HF transceivers? I primarily
want one to drive transverters for six, four and two meters (yes we have
70.0 to 70.5MHz as a ham band here in the UK).

Requirements as follows:

'Old' HF bands (not interested in WARC bands).
Spin-tuned VFO (no nasty synthesizers unless they step in 1Hz steps!)
Analog readout to 1KHz or better.
AM/FM/SSB capability.
High resistance to crossmodulation (i.e a tube frontend!)
Room for lots of filters (15KHz, 6KHz, 2.4KHz and 600Hz).
Plenty of audio output (at least 4 watts to external speaker)
Input socket for ALC from transverter.
Able to run 100% duty cycle for at least 1/2 hour on FM/AM/RTTY duty.
User-serviceable without any need for special tools, non
miniature components, no surface-mount devices, and finally;

No Gimmicks! I dont want scanning, memories, voice IDs,
speech processors or any of that sort of stuff.

Somehow i think i have just described a member of the Drake '4' line....
alas these seem to be somewhat scarce on the European secondhand
market. Some of the early TEN-TEC gear also seems a possibility (before
ten-tec got bitten by the microprocessor bug!).

Work you on Six soon???

>Apple Computer dealerships. The local store is even closed Saturdays.
>On the plus side, they're back in the hi-fi stereo kit buisness.

I noticed the latest Heath catalog ("Volume 220", Spring 1990) had a "market research" survey form enclosed in the middle. It was also an entry in a sweepstakes to win $1000 worth of their products. They are chintzy enough that it wasn't Business-Reply Mail, but I decided to invest a stamp, and, since I was doing so, included a couple-page letter of suggestions and customer feedback. I recommend that all other current and former Heath customers do the same -- if they get inundated with user responses, maybe they'll pay attention to at least some of them!

My product-line suggestions included that they come out with a decent-quality $300-$400 range tabletop shortwave receiver, since that is a market void right now, and that they look into the high-end audio market in the areas of minimalist preamps and tube power amps. In both cases, I emphasized that they should first publicize their plans and talk to experts in the field and solicit user input, doing things like going to the ANARC and Monitoring Times conventions to talk to SWLs about radios, and talking with the staffs of The Absolute Sound nd Stereophile about audio gear. Maybe that approach will help them avoid mistakes like their last lousy SW receiver that got such bad reviews.

As a side issue, does anyone out there know when Heath started? The catalog doesn't say. I expected to find some sort of advertising puffery like "serving America's electronic hobbyists since <date>" in it somewhere but couldn't find any such reference. I thought they began in the early '50's. Anybody on the net know for sure?

>
> I agree heartily. And when they get their new ham tickets (either code or
> no-code variety), they can tack on amps and boost their range. Hurrah for them!

As has been stated many times before in this forum, The INTERNET can not be
LEGALLY directly gatewayed to amateur radio. The content of 90% of the traffic
is unsuitable for amateur radio transmission.

However I applaud the use of radio to extend this kind of service to people
who would otherwise have no way to get access. I have long been an advocate
of using the technology we have developed to bring more and better service
the the general population. I think that packet radio technology can be put
to use in building inexpensive networks for lower level schools who don't
have the resources of a university.

Maybe if we as hams started setting these systems up and showing schools and
libraries etc. what could be done with it, we might win back that mystique
we once held with the general public. Radio by itself no longer mystifies
anyone, but we have much more than that to offer today. Lets stop hiding
our lamps under bushel baskets and get out there and show that there is more
to ham radio than field day.

2092. Re: Restricted Space Antennas...

Newsgroup: rec.ham-radio
Date: 1990-04-04 17:17:00 UTC
From: CSMSCST@OAC.UCLA.EDU
Message-ID: <9004050714.AA04260@ucbvax.Berkeley.EDU>
Source record: 12387

Take a look at the section "small loop antennas" in the "antennas for limited space" chapter of the ARRL Antenna Book. Several people on this conference have reported excellent results with small tuned loops on HF. The primary disadvantage of these antennas is that they have a very small bandwidth; other than that, they radiate like gangbusters. The solution to the bandwidth is to have a remotely tuned motorized capacitor.

Also, note in the latest QST, AEA is advertising a 32" small loop for 14-30 Mhz, 150w. It has remote tuning. Sounds like a winner -- has anyone actually seen one, or a price?

Incidentally, these might make interesting Field Day antennas. They are sharp enough that they'd substantially reduce QRM and overload from positions working CW and phone on the same band.

2093. electronic components dealers?

Newsgroup: rec.ham-radio

From: washer@unisoft.UUCP
Message-ID: <2909@unisoft.UUCP>
Source record: 12400
Cross-posted to: rec.ham-radio,sci.electronics

Forgive me if this has 'been done to death', but I haven't seen
it since I began reading these newgroups. (~6 mos)

I'd like to assemble a list of 'electronic component dealers'.
If you would care to mail me a list of your favorite dealers
along with phone number, address, and any 'speciality', I will
assemble the list, verify the addr and numbers, as well as things
like 'catalog available', 'minimum orders', etc and post the list.

Once again, if this has already been RECENTLY done, I beg your pardon.

Thanks in advance

Source record: 12416

>Excuse my intrusion into this ham group but I think this is the best
>place to get my technical question answered.
>
>RF input power; RF output power;

Actually, the *input* power shouldn't be expressed as "RF" power; the typical input power measurement - and the basis for most power-limit regulations - has to do with the DC power supplied to the output stage. This is simply the product of the DC supply voltage and current delivered to the final stage, except for any filament supply (if any).

The RF *output* power is just exactly that, and is intended to mean the actual honest-to-God RF power that the output will deliver into its nominal load - usually 50 ohms for amateur and CB transmitters. It can easily be measured via an in-line wattmeter or by RF voltage measurements on an appropriate dummy load. The output power is obviously less than the input power, as no amplifier can be 100% efficient. 4W out for 5 in is pretty unrealistic; your 2.5 - 3.5 (at the outside) figures are much more believable for an AM transmitter with a typical output stage. Output power, as measured in this manner, in NOT dependent on the antenna used, although everything after the output stage - cable losses, whether or not the antenna is properly matched, etc. - plays a part in determining how much of the output actually makes it out as useful radiated energy. "Gain" antenna such as a beam or quad do not actually increase the power, they simply concentrate more of the radiated energy in one direction (at the expense of all others).

A favorite marketing ploy for CB transmitters which include single-sideband mode (SSB) is to quote the "peak envelope power", or PEP. This number CAN be greater than those quoted for AM outputs, as power measurements for SSB are not as straightforward as those for AM; the SSB envelope precludes the simple voltage-across-the-dummy-load technique as a meaningful measurement. However, the *DC* input to the final stage is still the same, and that's what the FCC is (or at least used to be) concerned about. (I believe that the CB regs were revised to limit the RF output power to 4W some time back for AM rigs, with an appropriate PEP number for SSB transmitters.)

I write:

Just to clarify myself - I'm not at all in favor of dumping the 902 band.

The statement that Dave highlighted was meant to be sarcastic, for those
of you that didn't catch on. What I'm trying to say is that if hams
would start using 902, we would have more of a say in whether or not we
get to keep the band as well as what other services/emissions should be
allowed on the band. Sitting back and complaining that the FCC is taking

our bands is not what's going to cure the problem - you have to use them regularly. 902 is almost only used during contests. Very few people use it for normal day-to-day communications and there are hardly any repeaters on 902. Since there's nobody there, everybody seems to have the attitude that there is no reason to use it if you're not going to have anybody to talk to. This is true. But, look at 2 meters. 20 years (or whatever) ago, there were no 2m repeaters, nobody on 2m FM. But look at it today. All that it takes is some interested people getting on the band and actually using it - even if at first it's only for contests. Hats off to those guys out there who actually use this band.

2097. Novice or Technician exam?

Newsgroup: rec.ham-radio
Date: 1990-04-04 18:25:47 UTC
From: nicholso@hpcuha.HP.COM
Message-ID: <11390001@hpcuha.HP.COM>
Source record: 12418

I have a question about what exams to take. But first some history.

I got interested in electronics when I was in grade school, sometime in the mid '60s. I started studying for a ham license, but lost interest (what's the average 6th graders attention span?) when my code speed was only 2-3 WPM (remember code practice LP's?) Well just the other day, when I was trying out some PD and shareware programs on a new PC, I found a Morse code training program. I discovered that with a few minutes practice that I could now copy alphabetics at 5 WPM! Osmosis or something.

Anyway I looked at some license prep books, and decided that I could pass the written for both novice class (2) and technician class (3a). But one of the books recommended against taking both tests at the same time.

So my question is: should I take one or both? What's the problem if I try to take both exams at the same time?

Thanks,

Already being done! Here's the info for Canadian MODS DATABASE:

From: bitlib@business.uwo.CA (Business School Server)
Newsgroups: rec.ham-radio
Date: 4 May 89 16:13:00 GMT

This file is: INTRO MODS

MODS database
---- --------

This database was setup to archive files containing information on
how to modify radio equipement to either improve its performance,
or add new functions or capabilities to the radio.

This database runs on a IBM 4381 under VM/CMS. The driving software
is a homebrew list exploder with extra routines to handle file requests
from mail. The software was written in REXX and is available to whomever
likes to take a look at it. It was my first real REXX program so be gentil
with regards to beauty of the logic.

To access a file from the archive, send a message to the server running
under userid -> BITLIB@UWO.CA
Also you may try the userid -> BITLIB@UWO.CDN

The subject of the message must be -> MODS

The text of your message descibes what files you want. For example:
sendme intro mods
sendme radio mods
sendme TH215 mods

You can have as many requests in the same message as required.
INTRO MODS is the file you are reading now.
RADIO MODS is a list of files available.
TH-215 MODS is a file that can be requested.

To submit a file for the database, send me the message and I will
add your entry to the database.

**Note: If you don't seem to be getting a reply to your requests, it is
probally due to the fact that your header doesn't show a reachable

address. You must be reachable from UWO. You can place your return
address in the first line of your message. Example:
FROM: someuser@somenode

UUCP users have had some success by stating their address as:
userx!usery!userz@julian.uucp
Julian can usually find most gateways.

Any questions or concerns can be directed to:

Mark Bramwell VE3PZR
University of Western Ontario
School of Business Administration
London, Ontario

Bitnet: MBRAMWEL@UWO.CA Packet: VE3PZR @ VE3GYQ

If you are having difficulties getting into the server, you can try anyone of
these addresses:

bitlib @ business.uwo.ca .ca .cdn & .bitnet are all
business.uwo.cdn acknowledged by our system
uwovax.uwo.ca
uwo.ca
uwovax.uwo.bitnet

Our mail system will re-route requests for bitlib to the proper id once it
has made it onto campus.

Also, just because you made it to bitlib, does not mean that bitlib can
reply to you. Lately I have been getting alot of usenet mail bounced back
to bitlib.

If you reply address is different than your address in the FROM: line of
the header, please make the first line in your message a new FROM: line
EXAMPLE:

FROM: jdoe@central.yalevm.bitnet

If after a few days of no response, you can try the following:

FROM: HAMRADIO

This tells the server to post the response to the INFO-HAMS digest!
Since everyone can read the digest, you will eventually receive the reply.
INFO-HAMS and REC.HAM-RADIO seem to be the same thing (gatewayed <>)
Please don't post numerous files to INFO-HAMS using this method else
it might get messy(nasty) on the net.

de VE3PZR, Mark in London.

From: MBramwel@business.uwo.CA (Mark Bramwell 519 661-3714)
Newsgroups: rec.ham-radio
Subject: ftp access for mods database

The mods database is now available through the internet.

IP address: 129.100.22.100 HAMSTER.business.uwo.ca

If you want to post a file, please email it to me.

A separate copy is stored on the IBM 4381 for mail users, therefore
I need to know if a new file comes in.

Enjoy, let me know if you have any problems.

2103. College and Univ. Net on 10m

Newsgroup: rec.ham-radio
Date: 1990-04-04 21:41:12 UTC
From: sek9424@cec1.wustl.edu
Message-ID: <1990Apr4.214112.4872@cec1.wustl.edu>
Source record: 12406

For those interested, the first real convening of the College and
University net went fairly ok. Propogation was really good to the western
US and we spoke with several stations. Unfortunately, only one was really
affiliated with a university. I don't have the calls at hand, but the two
gentlemen were mobile and were from UCSD. We discussed the possibility of
them operating from the site of a crew regatta their school is sponsoring.
Wash U. is participating and I am sure several other schools that may have
radio clubs are as well. The competition is this weekend and I got the
impression that they would be there on Saturday. We are going to try to
link up with them and find out how our team is doing if they ever get back
to me with the times and freqs they will be on. (Yo, Andy! Are you out there?)
In any event, we will try to convene the net again this weekend.
Again that is 28.425+-, Saturday at 1800Z. Control will be W0QEV here at Wash U.
If you have any questions, let me know. Hope to see you on the air....

73,
Scott - KA0WCH

> over say 500 QSOs. This might cut down the competition. A more
> positive reason would be getting an audited log back. I would be
> happy to pay $10 to $20 to get back a floppy with my cross checked
> QSOs. A simple flagging of unique QSOs would be of value.

Your raise some very valid points. We ruled out any requirement
for submitting logs on diskette, simply because not everyone uses a
computer or even has access to one, especially DX stations. However,
we are considering various proposals for offering incentives to submit
logs on diskette. I think yours is a good one - in fact the CQ Contest
Committee will return anyone's submitted log on disk with a list of
uniques and the average unique rate for that class of entry. They also
reduce the penalty for busted calls and unmarked dupes if logs are
submitted on disk.

> First, you say, "aligned by column", what does that mean? I assume
> that you mean in fixed width columns padded (on the right or left?)
> with ASCII blanks and with a single blank between columns. How about
> a comma between columns?
Yes, that's exactly what we meant. "Aligned by column" would allow
the log checking staff to "screen" each log as at comes in and to assign
columns to each piece of data, assuming that data item (and no other data
item) is always located within the assigned field . The alternative would
have been to read each line and look for a data delimiter, such as a space,
tab or comma. The majority of log submissions are formatted in columns. The
left or right justification doesn't matter, as long as the data is contained
within the assigned columns. The reason for specifying 15 columns for the
call is because that is the maximum envisioned length of a call (e.g.,
FG/KA1XYZ/FS/m). It would be desirable to have the total column width
under 80 characters, though not absolutely necessary.

> The statement "Complete exchange sent" and "Complete exchange
> rcvd" is not very specific. What about contest like SS where there

> are long exchanges? Should there be blanks in this column making it,
> in effect, multiple columns or do you want something like
> 123BWB2UMF65EMA as one hunk?

Again, as long as each data item was "lined up" by column it would
be OK. Maybe a better choice of words is needed instead of "aligned by
column", which could be misinterpreted. Any suggestions from anyone?

> While there may be a few popular logging programs that many
> people will use, some of us will want to roll our own. You need to
> specify EXACTLY what the ARRL will and will not accept. I have been
> writing software for 30 years and the single largest cause of problems
> is lack of a clear statement of what is wanted. Do not assume that
> the world of amateur programmers out there will know what you mean.

Yes, we didn't want to discourage anyone from "rolling their own".
Ironically, we started off proposing a very rigid ASCII format and
subsequently decided to "loosen up" the format in order not to discourage
anyone from submitting a log on disk. I agree that the specification
needs to be reworded in order to make it "perfectly clear" what's required.
The proposed policy on accepting other formats is that they will be
accepted, but must be accompanied by a paper log. However, we hope that
simplicity of the proposed format will encourage submissions in that
format. Regarding non-MS DOS, there's a 24-hour BBS is available for use
in submitting logs, and may be an attractive alternative for people like
you who make less than several thousand contacts - hi! All you need to
do then is send a signed paper summary sheet in the mail.

Any comments received will be passed along to the ARRL Contest Advisory
Committee, all other contest-related comments are welcome... An SASE with
85 cents postage to my Callbook address will bring you copies of CAC
correspondence related to the file formats, including the proposed format.

>
RF input power is the DC power at the last power amplifier stage.
The FCC used this type of measurement because it was easy to do with
simple DC meters.

RF output power is the power coming out of the last power amplifier
stage (and presumably to the antenna). It requires an RF power meter
to measure it.

The difference betweent the two powers is accounted for by the
efficiency of the amplifier.

My interpretation of the ARRL log file format requirements indicates that they are intending, at the present anyway, to just PRINT out the file you send them.

It would be nice if a general purpose file format can be designed for logging info that can handle a large number of cases and contest types. I believe it can be done, and done more efficiently than a plain printable format.

Does the ARRL accept the files compressed? I don't know yet if large logs in the format they now want would fill up a disk. They should be prepared to accept some of the defacto standards, such as .arc, .tar.z, .zip, .zoo, and .z extensions.

There are THREE possible ways to increase the usage of 33cm:

1. Increase the amount of radio activity the users of 33cm do.

2. Increase the number of hams and hope the new ones use 33cm.

3. Move some of the hams from other bands such as 80m and 20m to 33cm.

Given an already very low number of hams on 33cm, if each ham were to
operate 16 hours a day, it would still not be enough.

Of course the current "no-code" bunch is already trying #2. Now if all
the people who are against a no-code license, would do more of #3, then
maybe we won't need a "no-code" license.

Let's set a goal. If 50,000 amateurs will change their primary operating
band from an HF band up to 33cm, and operate at least 3 hours per day,
then I will back down from my efforts to get more hams who are interested
in UHF into the hobby by means of a no-code license.

6 users in one area don't constitute sufficient usage to make the band nearly used as other land mobile services use their bands.

Unless we can get MOST of the OF's off HF and onto 33cm, we might as well write the band off for anything but a few isolated point-to-point links which could be just as well done on 23cm or 13cm.

Hello there,

Could someone tell me a little bit about DIGITAL RADIO and its furure worldwide? How is it going to surpass FM and AM?

How is the FCC will be allocating the frequencies and what are the major public policies involved in the USA?

Some references would also be helpfull.

Thanks!!!!

I am making QSL cards and am trying to find out what grid square
my home QTH is in. The city (village) is Sister Bay, WI
Looking on a 15' topographic map, I estimated :
40 deg, 11.5' N, 87 deg, 7' W
But looking at the National Atlas of the US (published by the gov't) says
45 deg, 11.3' N, 87 deg 7.3' W
I dunno if this is city (village) hall or not, but
a) Sister Bay isn't all that big
b) I live pretty close to village hall
I know there was an article in the (aug 89?) issue of QST, but all the 89
issues are missing at the library. I would like to know how to find out my
grid square and/or what it is. I really want my SIO (oops)
SIX digit grid square (yes, 6, and yes, I am wierd)

Since I doubt this information is of interest to anyone else, I think
e-mail would be appropriate. Thanks.

2117. Maidenhead Grid Square System

Newsgroup: rec.ham-radio
Date: 1990-04-05 11:45:04 UTC
From: kjh@pollux.usc.edu
Message-ID: <23911@usc.edu>
Source record: 12423

Somebody asked about the Maidenhead Grid Square Locater System. Here are the details of how this system works. This system is in widespread use in North America on VHF/UHF/SHF/EHF. I believe that it is also catching on in Europe. I think it is one of the best location identification schemes ever developed.

The world is divided up into fields. Fields are divided up into squares. Squares are divided up into sub-squares.

Each field is 10 degrees N-S by 20 degrees E-W.
Each field is indicated by a two (capital) letter identifier. The South-Western most field is AA. This field is actually a triangle, and it is located from the South Pole to 80 degrees South, and from 180 degrees West to 160 degrees west. The field directly north of AA is AB. The field directly north of AB is AC. The field directly east of AA is BA.

Each field has 100 squares. Each square is 1 degree N-S by 2 degrees E-W. Each square (inside it's respective field) is indicated by a 2 number identifier. The South-Western most square in a field is 00. The square just north of 00 is 01. The square just north of 01 is 02. The square just east of 00 is 10. The North-Eastern most square in a field is 99.

It is meaningless to refer to a square, without first identifying it's respective field.

For most amateurs, this is enough. On VHF, for example, when I lived in Grand Rapids, Michigan, I identified my location as EN72. On higher bands, (or maybe for other reasons), you might want to identify your location more accurately. For this, sub-squares are used.

Each square has 576 sub-squares. Each sub-square is 2.5' N-S by 5' E-W. Each sub-square (inside it's respective field) is indicated by a two (lower-case) letter identifier. There are 24 x 24 sub-squares in each square; each sub-square is pretty %^&* small. The South-Western most sub-square in a square is "aa". The sub-square just north of this is "ab". The sub-square just east of "aa" is "ba".

It is meaningless to refer to a sub-square, without first identifying the field and square.

When operating on the higher bands from my GR, MI QTH, I identified my location as EN72eu. To wrap this up: The fields, squares, and sub-squares adjacent to mine were:

EO

EN73

EN72ev

DN EN62 EN72du EN72eu EN72fu EN82 FN

EN72et

EN71

EM

This is my biggest complaint against Kenwood. They use the cheap chassis mount connectors. For just a few pennies more, they could put a panel mount connector that would never wear out or need replacing. The panel mount connectors have a square flange, and four mounting holes. I have had to replace every connector on my Kenwood gear. Why must they all produce chinsey gear? Whatever happened to quality?

2121. Digitial Audio (response)

Newsgroup: rec.ham-radio
Date: 1990-04-05 13:48:11 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9004051348.AA05544@cmr.ncsl.nist.gov>
Source record: 12414

Koffi Magliore asks about the status of Digital Radio. I gather, from following Broadcasting magazine, that digital radio is going to be real in Europe fairly soon. The interest there mostly centers on Direct Broadcast Satellites (DBS), with gap-fillers on the ground for tunnels, etc. Filling in the blanks in the non-technical articles, some sort of pseudo-random coding is used, since they talk about multipath being a benefit to improve coverage. A big pitch and demos happened at the (US) National Accosiation of Broadcasters (NAB) covention last weekend in Atlanta. It is recognized that US policy on broadcasting would require Digital Audio to be a terrestrially-based service here, not DBS. Numbers bandied about include up to 24 audio services multiplex on a 4-MHz bandwidth transmitter. The Europeans (often French) who are pushing the most, talk about using schemes to reduce the required bit rate by "not sending the unneeded part of the sounds". (see more below)

As hams, we should be most concerned by the statements that the Digital Audio people have decided that the 500 to 2000 MHz region is the only one suitable, and that they need about 100 MHz of that region!!!!!

Currently, there is a fair amount of digital audio used to distribute radio programs by satellite. While I would reallly like to know more about the subject, the scheme seems to be to sample the incoming audio at 32,000 15-bit samples per second (barely adequate for the claimed 15 kHz response), and block the samples into groups of 32 (or is it 64 for stereo) [one millisecond worth]. A scale-factor is then determined for each block, and the block is sent with 11-bit audio (not the 15 bits of the original samples), with a single scale factor for the whole block. The process is reversed upon reception to compander back to a 15-bit dynamic range (~ 90 dB). Note that the distortion is roughly that of an 11-bit signal, say 0.1 %. National Public Radio uses this system and markets it commercially. ABC-radio also distributes by digital audio.

My knowledge is sketchy, in that I don't know what 7-8 code expansion they use, what error control, etc., etc. The equipment, from Scientific Atlanta and others (?), gets about 24 channels on a single transponder, any 15 kHz audio channel can be split into two 7.5 kHz channels, etc.

Does anyone have more (or better) info?

>I had thought that Litz wire was the stuff used for the cords of old-
>fashioned headphones, mostly because it was limp. Is this true? Is
>that difficult-to-solder stuff used for cheap earphones Litz wire?

No, that frustrating stuff is called _tinsel_ wire. It's completely
different from Litz, and is used in telephone cords because it is
designed to not break with repeated flexing. It's usually used
with crimped connectors. The only way I've been able to solder the
stuff is to laboriously unwrap each little flat strand of copper
(bronze?) from its fiber core, then twist them together and use solder
flux.

>I recently went looking for a crystal earphone for a project which
>needed a high-efficiency, high-impedance audio output. Surprise!
>Nobody makes those anymore. They're impossible to find...
>I guess that means kids won't be able to build simple crystal radios
>anymore :-(

High-impedance earphones went the way of vacuum tubes, but it should
be possible to make excellent and sensitive earphones with the
piezoelectric substances now available. I'm also looking for some
nonmagnetic earphones to use with my 3.5kHz "cave radio" because
feedback from phones to loop antenna is a problem.

>convenient that it was already dialed in? :)

The Bro! sez...

One day last year "me 'n' the boys" (the other guys in the Texas A&M
Amateur Radio Club - W5AC) watched Die Hard on video and could not keep
ourselves from laughing at this.

In answer to your question about his knowing the police frequencies, he
didn't have to. Quite insultingly, the Kenwood radios used were supposedly
(ACK!) CBs!!! Early in the show, he gets on the roof of the building and
says "Channel 9" something or other... don't ask me why we are supposed to
swallow the idea that the police use CB radios, but I guess it works for the
uninformed public. Hey, they used them on the Dukes of Hazzard!

The thing we couldn't get over was their blatant abuse of radio operation
procedure. For instance, the ability to interrupt someone while he is
talking on another radio. Full-duplex HTs??? Right.

This was most dramatically demonstrated when the hero was patching up his
well-cut and bloody feet in a restroom. He somehow locked the HT on transmit
and was able to carry on a conversation with the cop down on the street.
What a laugh.

As I said before, though, I'm sure for all Americans that have never touched
or used a radio it works. We just have to laugh and enjoy the inside
joke ourselves.

2124. Re: HF Transceiver to drive transverter.

Newsgroup: rec.ham-radio
Date: 1990-04-05 16:12:57 UTC
From: glenne@hpnmdla.HP.COM
Message-ID: <1250141@hpnmdla.HP.COM>
Source record: 12130

I found myself trying to make a similar decision about a year ago.
I was replacing a previous station which had been robbed and I
wanted a multimode transceiver to drive my transverter array;
I have a 50 MHz through 10 GHz phase locked "transverter stack"
(Feb/Jun/Oct 1988 HR Magazine) and wanted something to drive it with.
Since I'm getting old and don't learn new interfaces as easily I
wanted to buy two of the same radios. That way I could operate two
vhf-microwave bands simultaneously, or liaison for a vhf-microwave
schedule on HF without getting confused about which button to
push.
I ended up getting two IC735s. The 725 was available as was the TS440
but I wanted passband tuning which the 735 doesn't have and Kenwood
seems to have forgotten about transverter support on their newer
radios (:>[
By cutting two diodes I get general coverage transceive out the
transverter output.
The performance of the 735s seems to be a good deal better than any
tube type transceivers I've ever owned including two Drake Lines and
an R4(solid state). Third order intercept, dynamic
range and spurious performance seems very competetive and phase noise
is also acceptable. The 735 is specified better than the newer DDS
Icom radios too.
They aren't perfect radios but I've had one of them running full time
for over a year driving a 2M transverter (on packet) with no failure.

Hope this helps.

2126. Re: ARRL file format comments

Newsgroup: rec.ham-radio
Date: 1990-04-05 16:33:00 UTC
From: RJA%UTRC@UTRCGW.UTC.COM
Message-ID: <9004051133.RJA%UTRC@utrcgw.utc.com>
Source record: 12419

In response to KA9WGN's comments on the ARRL file format:

> My interpretation of the ARRL log file format requirements indicates that
> they are intending, at the present anyway, to just PRINT out the file you
> send them.

No, the ARRL Contest Branch will read the file, convert it into a
binary format and then add it to a database of contest files. Each file
will be checked for dupes, the multipliers will be determined and counted,
and the log will be scored. They will also be able to do cross-checking
and unique call sign analyis of logs (identifying calls which are "unique"
to that log compared against a database of all known good calls, active
calls in contests, calls contained in other logs or calls who's log has
been submitted). The uniques analysis capability is being developed --
other groups such as the CQ Contest Committee and various individuals have
been doing "uniques" analysis for a number of years. A contact labeled
as "unique" MAY be a bad call, but not necessarily. A high unique rate
raises eyebrows regarding the accuracy of log, but is NOT absolute proof
as to the accuracy of a log. It's analagous to the IRS, but hopefully
the logs are more accurate than tax returns...

> It would be nice if a general purpose file format can be designed for logging
> info that can handle a large number of cases and contest types. I believe it

The format we developed should handle all contest types since the
data in it is common to all contests. A binary format (rather than ASCII)
would be more efficient -- considerable discussion of binary vs. ASCII
took place before we decided on our course of action, which was described
in the original posting.

> Does the ARRL accept the files compressed? I don't know yet if large logs
> in the format they now want would fill up a disk. They should be prepared
> to accept some of the defacto standards, such as .arc, .tar.z, .zip, .zoo,
> and .z extensions.

You raise an interesting point. I don't see why not as long as it was
a commonly used compression routine. But 99% of the logs should fit on a
360K floppy without compression.

> I had thought that Litz wire was the stuff used for the cords of old-
> fashioned headphones, mostly because it was limp. Is this true? Is that
> difficult-to-solder stuff used for cheap earphones Litz wire?

This stuff is commonly called "tinsel wire". It is used where the cable
will be subjected to lots of flexing, so you find it in guitar cords (the
coiled kind) and in older telephone handset cords. It is not the same
as Litz wire, since the individual conductors are not insulated (although
it probably would work similarly, due to the insulating fiber filler and
the tinsel-like shape of the conductors).

Most of time the connections are crimped, and I hope I never have to solder
tinsel wire again.

This weekend on the College and University Net, we are going to try
to have a special event station set up in San Diego at the Crew
Classic to attempt to pass traffic and messages for the various
colleges and universities that are participating. I will try to be
on the air at 1800Z on 28.425. Hopefully the conditions (weather
and RF) will be satisfactory for the event. If you want to be
involved in this, please tune in this Saturday. Please note, we are
trying to get this setup in a hurry, so if things dont work out,
please continue on with the net as normal. I will try to call with
my callsign (N6WUY). This is also not sanctioned
by anyone, so we are just going to wing it. If you have any
questions please REPLY by email not the net.
I will check my e-mail regularly. You can mail to any of the addresses below.

Talk to you this weekend (hopefully). 73 de Mike

I own an old Bearcat 210xl scanner which I bought back in 1985. With all the discussion of extended receive modifications available for various scanners, I began to wonder if anyone has ever modified their 210xl, especially since it has rather limited scanning ranges.

There are no mods posted to any MODS databases that I am aware of. Post or email replies. Thanks.

And, be fully prepared to pay MORE for a service which costs the telco LESS to supply than it does for them to supply voice lines for the modems. Just like when they charge you more for DTMF dialing than for rotary dialing.... They save money, and you pay more for it. (It takes fewer DTMF receivers and dial registers to accept DTMF tones, partly because you spend a lot less time dialing with DTMF (on average) than with rotary.)

Oh, well... (and no smiley this time!)

No, this is not litz wire. The stuff in earphone wire that's
impossible to solder is just that--tiny metal wires or films wrapped
around a fiber core.

Litz wire is a bunch of strands of conductive wire that are
electrically isolated from one another except at the two ends.

2137. beginner projects for radio amateurs (looking for)

Newsgroup: rec.ham-radio
Date: 1990-04-06 04:39:55 UTC
From: bill@b11.ingr.com
Message-ID: <7784@b11.ingr.com>
Source record: 12135

I am fairly new to amateur radio (licensed last november), and am interested in building some simple "rigs". My main purpose is to gain some practical experience in working with transistors, analog circuits, and radio circuits in particular.

I would like to hear from any of you that have similar interests, (especially you elmers out there :-).

I would also like to hear recommendations about books, magazines, etc. Also recommendations on mail-order part supply houses, as I am not close to any large metro areas. For example, a couple of the projects call for an audio transformer (10k to 2k), and I haven't had any luck finding it locally.

I have access to the following books:
Solid State Basics for the Radio Amateur - ARRL (this is is just about right for me, albeit a little old, eg no WARC bands)
Solid State Design for the Radio Amateur - ARRL (probably great, but over my head right now)
Understanding Amateur Radio - ARRL (good, but tries to cover a lot of material in one book)
QRP Notebook - ARRL (looks really neat, but it assumes the reader is already pretty comfortable transistors, etc)

Note: The fact that some of the above books are over my head doesn't mean that the books aren't good-- they just aren't aimed at beginners.

So, I would sure like to hear from you folks out there. By email, or on the air sometime. I'd love to tune in to a nice discussion on building QRP rigs, etc. I operate on 80, 40, 20, 15, and 10M.

Thanks in advance! de kc4mxj bill welch uunet!ingr!bill

2138. how to achieve 20WPM ?

>It seems to me that amateur international communication could be served
>by the availability of a public-domain translation system for use with
>PC-based communication systems.

This is out of my area, but my understanding is that these systems are
either very limited in what they can do or are quite big and expensive,
or both.

But this *is* a most interesting topic. The development of packet radio has,
for the first time, made it possible for amateurs to send and receive
error-free text with a bandwidth almost large enough to do some real
human-to-human communicating. (Unlike CW, which I suspect is called the
"ham's universal language" because it's so slow and unreliable that you
spend all your time in standardized QSO overhead -- you never get far enough
to hit a language barrier! :-))

Ahem. Seriously, I think many more people might be more willing to practice
a foreign language by packet than by voice, especially when their knowledge
of the language is very weak. The main thing is that as long as the other
guy is patient, you can take plenty of time and use your dictionary if
necessary. Pronunciation and spelling ambiguities are avoided. Obviously
this doesn't help you learn the spoken form of the language, but it might be
a good way to get exposed to something you might not otherwise try at all.

2141. TVI/RFI - Need ADVICE !

Newsgroup: rec.ham-radio
Date: 1990-04-06 07:02:27 UTC
From: nfunamura%mis2.decnet@NUWES-LLL.NAVY.MIL
Message-ID: <9004060702.AA02217@ucbvax.Berkeley.EDU>
Source record: 12144

In Message-ID <1990Apr4.053057.7176@tandem.com>, Stuart Phillips writes:

<Folks, I need some advice.

<Since 12/88 I've been working a TVI/RFI problem with my neighbor. Initial
<problems such as 10 m interference with TV channel 2 were soon fixed (at
<my *small* expense) but his stereo system proved to be a first class
<receiver of 40 m and 20 m RF. As little as 5 watts on 40 m at some 80
<feet horizontal and 30 feet vertical separation causes severe hum on
<his ONKYO stero tuner/amp.
<.....

I don't know if this is the latest edition, but I have a copy of a 31 page pamphlet titled "How to Identify & Resolve Radio-TV Interference Problems". It was published by the FCC and is labelled "second edition, September 1982". On page 11, titled "Audio Inteference and Remedies":

INTERFERENCE TO AUDIO DEVICES (TELEPHONE, STEREOS, AM/FM RADIOS)
"Telephones, electronic organs, stereo/hi-fi equipment, or AM/FM radios can be susceptible to interference. The source of interference will determine the affect on your audio device. For instance, if the equipment is picking up a nearby radio transmitter, you may hear the voice of the operator. When electrical interference is present, you may hear a sizzling or popping sound. If you are receiving interference from a nearby radio transmitter, you should contact the operator and provide the Radio Operator Guidelines section of this handbook.

1. Generally, internal modification of your equipment must be made to eliminate the interference.
2. For safety reasons, it is recommended that any modification be made by a qualified service representative. The service representative should make the modification in the home while the interference is occurring, in order to locate the point at which the interfering signal is entering the equipment."

Further on the same page titled "OTHER AUDIO DEVICES"

"For other audio devices, such as stereo or hi-fi systems, the following steps may be taken before calling your service representative:

1. Replace unshielded wire between the amplifier and speakers with shielded wire.
2. Ground the affected equipment to a metallic cold water pipe or ground rod with a piece of 'bell wire,' which can be obtained at most electronic, hardware, or variety stores. Do not ground 'AC-DC' type devices. Normally, devices which may safely be grounded will provide a grounding terminal. If no terminal is provided, then you should consult a qualified

service representative for advice."

Page 12, "RADIO TRANSMITTER OPERATOR INFORMATION"

RADIO TRANSMITTER OPERATOR GUIDELINES
"Some interference problems can be traced to radio transmitters. When you receive an interference complaint from your neighbors, the following steps will help resolve the problem.
We encourage you to cooperate with your neighbor(s) and assist them in resolving the problem. When a positive dialogue between you and your neighbors exist, the problem will be more easily resolved.
It will also be most helpful to the commission and the general public if you would encourage a cooperative attitude among other radio operators.
Voluntary implementation of the steps outlined below, may prevent you from being directed by the Commission to implement these measures. The Commission does not, however, require that you service or modify your neighbor's TV set or audio device."

Sections on CB and Linears omitted.....

RESOLVING AUDIO INTERFERENCE
"Although audio inteference (often called audio rectification) is usually resolved by modification of the affected device, you as a radio operator can take certain steps to reduce the probability of audio rectification by eliminating circulating radio frequency (RF) currents in grounds and metal objects in the area.
1. Your radio transmitting equipment should be effectively grounded to a metallic cold water pipe or a ground rod driven into the ground at least 8 feet. The ground lead should be at least #10 wire or copper ribbon. The greater the surface area of the ground lead, the more effective it will be. Also, the ground lead should be as short as possible.
2. You are reminded that CBers are limited to 5 watts input power. Operating with excessive power is likely to cause audio interference problems.

If you need assistance in performing the above modifications to your equipment, you can contact the dealer or manufacturer's representative. An FCC-licensed service representative may also be able to assist you. A licensed representative normally will be available at your local CB repair or Service Center.

RESOLUTION OF INTERFERENCE FOR AMATEUR TRANSMITTER OPERATORS
1. If you have a linear amplifier on your amateur transmitting equipment, use two lowpass filters. One filter should be installed between the actual transmitter (exciter) and the input to the linear amplifier. (This prevents harmonics generated in the exciter from reaching the linear amplifier.) The second filter should be installed at the output of the linear amplifier to reduce harmonic and spurious content.

2. One unique interference problem to TV Channel 2 is from an amateur transmitter operating on the 6 meter band. This is due to the close proximity of the frequencies involved. You may wish to follow the procedures outlined in the Technical Information for Service Representatives section, page 23, to

eliminate this type interference. You are not, however, required to service or add filtering to the complainant's television, and should not take any such action without the full cooperation of your neighbor.

3. You are reminded that amateurs are licensed to use only the amount of power necessary to carry out communications.

4. Local Television Interference (TVI) Committees are available to assist you in resolving interference problems. Contact the nearest FCC district office (See addresses beginning on page 21), or the American Radio Relay League, Newington, Connecticut, for assistance in locating a TVI committee in your area."

Don't know what position the FCC takes today but this is what they said eight years ago. GOOD LUCK!

Throw out the code tapes, the computer programs, the computer (just kidding). To increase your code speed:

GET ON THE AIR AND HAVE REAL QSO's WITH REAL PEOPLE.

It's just that simple. You'll find that the fastest people are in the novice band. The next fastest are in the general class portion, just above the extra class portion. Work the people who are going just a little bit faster than what you can comfortably copy.

> SIX digit grid square (yes, 6, and yes, I am wierd)

Brian-
I hope this helps. The QST article which describes how to determine in which Grid Square you reside, was titled "VHF/UHF Century Club Awards" by John Lindholm, W1XX and was published in the January, 1983 issue on pages 49-51.

By the way, you're either in EN60ke (40 deg, 11.5' N by 87 deg, 7' W) or EN65ke (45 deg, 11.3' N by 87 deg, 7.3' W).

I suspect the latter, because my geography is relly screwed up, I don't see how any part of Wisconsin could be much further South than azimuth 270 deg from my QTH here in Rochester (FN13fb, lat. 43.07 N by long. 77.54 W).

By the way, there may be others interested in determining their grid locator, and I had to spend a fair amount of time looking through QST indices to find the article, so I thought I'd post this to help their search, as well.

2146. Second Annual Open House at WPI / W1YK

Newsgroup: rec.ham-radio
Date: 1990-04-06 13:22:38 UTC
From: jwhitson@WPI.WPI.EDU
Message-ID: <9004061422.AA04099@wpi.wpi.edu>
Source record: 12138

On April 7, 1990, at Worcester Polytechnic Institute
in Worcester, Massachusetts, the WPI Wireless Association
will be holding The Second Annual Open House in its Ham Shack.
It will run from 10:00 AM to 4:00 PM (EST). We will be working
on many bands (160m - 10m, 2m, 440MHz, as propagation permits),
and in many modes. The Club Station, W1YK, is excellently
situated on the roof of Salisbury Laboratories, which is one
of the buildings on the top of a large hill where WPI is located.

Come and help us celebrate our 81st Anniversary!

New Information
In addition, W1YK will be trying to WAS on as many bands as
possible, so if you can't be there, listen for us! Talk-In Frequency
of 146.925 (-). It is supposed to snow a bit, BUT THAT WON'T STOP US!
And we hope it won't stop you!!!!!

Humerous Section
BRING WOMEN!! The Male/Female Ratio at WPI is 7/1, and there are
NO female members at the Radio Club!! We've got SATELLITE capability!
Come and get spaced-out!! Come anyway!! PLEASE!! Packet Too!!!

Once again, feel free to call us or whatever for more information.
The phone in the shack is (508)831-5446, and we listen to the
Worcester Repeater at 146.925 (-). Or send email to me:

>% 2) On 3 different radios(transmitters) I see the following:
>% a) RF Input- 5 Watts; RF Output 4 Watts
>Somebody is lying. Possibly in the marketing department.

Actually not, it is real easy to get 4 or more watts out of a CB with only
5 watts DC input (quiescent). (Maybe even 10 watts out for only 5 in...
it's not magic, its bending the rules just a bit).

>% b) RF Input- 5 Watts; RF Output 3.5 Watts
>This I find hard to believe also, but it might be possible for a "plate"
>modulated class C final, for AM only.

Actually this may be quite accurate, CB final outputs are "PLATE" or
as we in the biz say "collector" modulated class C amplifiers. I'd
expect to see a realistic 3.5 watts out under normal conditions.

>% c) RF Input- 5 Watts; RF Output 2.5 Watts
>This is easy to believe.

If this is true, then the transmitter isn't working efficeintly.

OK JOHN, HOW DO YOU GET ALMOST 5 WATTS OUT FOR ONLY 5 IN WITH AN AMPLIFIER
THAT ISN'T RUNNING ALMOST 100% EFFICIENT?

I'm glad you asked. Its easy, just bend the rules a bit. How?

Look at the diagram of any of the modern CB rigs. You may notice a diode
and a capacitor in the audio circutry feeding the collectors of the driver
and final RF amps. Simply put, the non modulated DC input to the final is
in fact ~5 watts. If one were to whistle into the microphone and produce
a nice sine wave, a portion of the audio amp power output is converted into
a little extra DC power that "kicks the power up to the final amp" during
periods of modulation. This nonlinear pumping of the final power will not
cause enough distortion to cause any noticeable degredation of the signal
quality. (HAHAHAHAHAHAHAHAHA) And it may be close enough to legal that the
FCC lets it slide. Thus, one will note that the appearent power output,
when measured with a BIRD watt meter, will actually go UP if you make sounds
in the microphone. This shouldn't happen on a real collector modulated
RF transmitter, but it does on CB's.

Love it when those marketing folks figure out a way to adjust reality!

the original poster is on vacation?

2151. Re: how to achieve 20WPM ?

Newsgroup: rec.ham-radio
Date: 1990-04-06 17:24:19 UTC
From: bobc@hplsla.HP.COM
Message-ID: <5720062@hplsla.HP.COM>
Source record: 12153

I plan on taking the 20wmp test next week. For me, getting my speed up hasn't been too painful. (FLAME PROTECTION ON) I've learned to copy code using computer programs only. (FLAME PROTECTION OFF). I generally practice 30-45 minutes a night, and have been doing so for the last 2 weeks.

The program I have allows the send speed and the character speed to be adjusted separately. By setting the character speed at 20wpm and the send speed at 8-13 wmp, I had sufficient time between characters to recognize and record (using pencil and paper) the character being sent. Whenever I reached a point at which I could copy random character groups with 50% accuracy, I would bump the send speed up another 2-3 wpm. Occasionaly I would try and copy at 23wmp. Even though I could only get about 20% of the characters at that speed, it seemed to improve my ability to copy at 20wmp. I spend most of my time copying random character groups (letters, numbers, and puctuation). Usually, before I shut the computer off, I spend a few minutes copying regular text at 20wmp. I sometimes get in trouble with text because I try and second guess the word being sent. When that starts to happen, I have to try and ignore the message content and pretend that I'm back copying crypt groups. It works for me.

Good luck on your upgrade.

You also described the Drake TR-7 with remote VFO and cooling fan. It doesn't have FM as is, but it's no big big trick to modify for that. I used one for years and loved it. Wish economic concerns hadn't forced me to sell it. In the U.S. a good condition used '7 brings about $650.

The requirement to send hasn't been enforced for some time, as far as I know.
I had to send when I took my last exam in about 1976, but I think it was
shortly thereafter removed as a test requirement.

They started in the 30's marketing an airplane kit. No, not a model airplane kit. An honest to God get in it and ride it airplane kit. Then they had a boat kit and (I think) furniture. They returned to civilian pursuits immediately after World War 2 with a 5" oscilloscope kit based on military surplus CRT's and took off from there to where they are now - just another dealer for other people's products.

2155. FCC employees

The April 1990 issue of _Sport Aviation_ (monthly magazine of the Experimental Aircraft Association) has an article on page 31 entitled "National Airspace System Plan Forum Hosted by EAA." In this forum, Federal Aviation Administration representatives were asked pointed questions about new requirements for very expensive avionics, including 720-channel aircraft radios with 25kHz spacing.

The article quotes Gerald Markey, manager of the FAA's Spectrum Engineering Division, as saying:

"The FCC has about 2200 employees, 1100 of which are lawyers. Most of their decisions are legal rather than technical."

2157. Automatic reception of CW? Help!

Newsgroup: rec.ham-radio
Date: 1990-04-06 18:55:02 UTC
From: wille@hpccc.HP.COM
Message-ID: <5540033@hpccc.HP.COM>
Source record: 12161

I am interested in locating any computer code (preferably "C", but
I'll take ANYTHING) that *adaptively* converts dits and dahs (actually,
the individual bit lengths) into their equivalent characters. This is
the type of thing that some multi-mode controllers (like the PK-232) do.

It should be able to automatically determine the sending speed and
track it (if it varies) and adapt to the particular "fist" of the sender,
compensating for different ratios in the dit/dah/space lengths.

It would be nice if it had some AI-like features that tried to correct
errors (either in the sending, or due to static). For example, if the
character is not a valid letter, it may be two letters run together, or
a dah broken into two dits by static, etc. It could pick the most
likely candidate based on rules involving timing, context, etc.

Pointers to any articles written on the subject of automatic reception
of CW signals using adaptive techniques would be appreciated.

>guy is patient, you can take plenty of time and use your dictionary if
>necessary.

Mygawd, Phil--I hope you aren't suggesting that people do this during real-time keyboard-to-keyboard contacts. My experience is that most hams type so slowly anyway that it seems like eternity waiting for a response. I dread the thought of the additional delay that would be introduced if they're constantly consulting a dictionary and typing in unfamiliar words!

I don't think "patient" would describe a ham who'd be willing to sit through that. "Masochistic", perhaps. :-)

Patty

p.s. Yes, I know that people can begin typing their responses while the other person is sending, and buffer their text until it's done. But a fast typist can still catch a slow typist unprepared. Or maybe folks just aren't pre-buffering their responses.

>do people with questions call on a seperate line ?.

My understanding is that the connections will be one-way. Callers may leave questions on an answering machine which will be periodically "dumped" during the conference and read on the air in non-real time. The reason for this is to eliminate the air time that would otherwise be spent on overhead like bad connections, callers that hang up, requests to turn down radios to avoid feedback, etc.

The U.S. has an unofficial "ham" band at 160-190 kHz (1750 meters). Part 15 of FCC Rules and Regulations permit license-free operation in that band with the limitations of one watt transmitter power and 50 feet maximum antenna length.

Most 1750m operation is beacons; there are few two-way QSOs. 1750m operation is a challenge: A 50-foot antenna at that freq. must be super efficient-- It must have a very high-Q loading coil and a super ground system. Receiving requires sophisticated antenna preamps and converters, and selective audio filters. Atmospheric noise makes the band fairly useless in summer. The DX record on 1750m is over 1000 miles. The current hot topic among 1750m enthusiasts (called "Lowfers") is BPSK (binary phase-shift keying) at very low baud rates, using WWV-locked frequency control.

1750m transmitters are very easy to build. The newsletters listed below have published numerous plans.

Well, I *did* qualify my statement by using the word "patient". But the
fact that so many hams are willing to tolerate 1200 baud or even 300
baud packet in real time across NET/ROM networks or HF paths says that
there must be a lot more patience out there than you or I would give them
credit for.

Seriously, non-real-time email would probably be a lot more practical.

Phil

2164. TAPR TNC High Speed Serial Port Upgrade for 19.2 K baud

Newsgroup: rec.ham-radio
Date: 1990-04-07 02:31:32 UTC
From: 31002_1650@uwovax.uwo.ca
Message-ID: <5629.261d18c5@uwovax.uwo.ca>
Source record: 12168

This is a relatively easy modification that can be performed to most
TAPR TNC-2 boxes to allow 19.2K aynchronous communications between the
TNC and your computer.

FIRST *** Replay U3 (LM324) with a TL084CN or TL094 FET op-amp. The LM324
craps out at 9600 baud and is dead at 19.2K.

Cut the PC trace that goes to PIN 2 of U1 (divider) about 1/8 " from the
I.C. itself. Solder a jumper from pin 10 of U1 to the trace that you
just isolated. Solder to the side of the trace that goes to pin 1 and pin 6
of SW2 baud rate selector switch.

This supplies a 307.2 Khz clock (19.2K/16) to pin 1 which is now 19.2 K baud
on the serial port instead of 300 baud as well as pin 6 which is now 19.2 K
to the modem instead of 300 baud. Turning on SW1 and SW7 will allow 19.2 K
baud on the serial port and 1200 baud on the radio port.

**** NOTE ****

The 19.2 K baud rate is UNRELIABLE with the PMS code. We are using the
TAPR 1.1.6 code (or lower) without PMS and are having excellent results
on the serial port. The radio port is currently running at 9.6 K and is
connected to a G3RUH modem and a Kantronics DVR 2-2. Plans for next week
include increasing the G3RUH speed up to 19.2 K baud.

OHHHHH WHAT A FEELING.......

Some japanese companies have marketed calculator sized translating devices
do a word for word translation. At the Japanese-English Machine Translation
Conference in December I saw a calculator size device with a tiny scanner that
could scan english or japanese text and output the equivalent word on its
LCD screen. Students and tourists are finding these useful and perhaps
some japanese hams who see unfamiliar words on their screens while copying
a packet or RTTY signal. More ambitious work is done in the European
Community and Japan. Xerox has been successful with machine translation
by getting its tech writers to use a special limited vocabulary and simple
gramattical structures in the manual so as not to confuse the machine.
Sometimes big systems do a good job with over 90% reliability, but the
worry is what horrors lurk in the remaining 10% -- the poison cookie in the
cookie jar problem. At the translation conference it appeared that that
many good papers in linguistics bearing on the problem are being produced
while several japanese companies have translation systems up and running --
several running on a PC, generally an NEC PC-9801 series PC -- and
moving forward by making incremental improvements in hardware and software.
The difference in US and Japanese approaches to this problem seem familiar...

Yes indeed. A japanese ham told me on RTTY once he wouldn't dare
speak english. In many countries like Japan, people read English much
better than they speak it. An if we work 'em on packet perhaps their
written English will come along too!

2169. Re: Low Frequency Transmitters

Newsgroup: rec.ham-radio
Date: 1990-04-08 01:18:19 UTC
From: allbery@NCoast.ORG
Message-ID: <1990Apr8.011819.15197@NCoast.ORG>
Source record: 12173

As quoted from <40990@iuvax.cs.indiana.edu> by commgrp@silver.ucs.indiana.edu (BACS Data Communications Group):

> >VLF transmitter for LW beacon application. I understand there
> >is a frequency range somewhere around 150 Khz where experimental
> >beacons are A-OK. Does anyone have any information on this
>
> The U.S. has an unofficial "ham" band at 160-190 kHz (1750 meters).
> Part 15 of FCC Rules and Regulations permit license-free operation in
> that band with the limitations of one watt transmitter power and 50
> feet maximum antenna length.

Interesting. "Few QSOs" there may be, but I've heard at least one of them. I thought either I'd overheard pirates or the radio was acting up: I was about a mile from a set of TV transmitters, and within 8 miles of many other TV and AM/FM broadcast band transmitters; the radio was getting overloaded and doing *weird* things. But I could identify the "overloads" quite easily by their characteristics; the QSO I picked up didn't act like an overload.

2170. NASA Prediction Bulletins

Newsgroup: rec.ham-radio
Date: 1990-04-08 03:33:53 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9004080704.AA04452@ucbvax.Berkeley.EDU>
Source record: 12228

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial RCP/M, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial RCP/M may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

RUDAK-2 MULTI MODE TRANSPONDERS

HR AMSAT NEWS SERVICE BULLETIN 090.01 FROM AMSAT HQ
SILVER SPRING, MD MARCH 31, 1990
TO ALL RADIO AMATEURS BT

RUDAK-2 To Carry Mode B Linear Transponder & Packet Radio

RUDAK-2, the second generation packet radio experiment to RUDAK which was flown on AO-13, has now been completed, tested, and fully integrated into a Soviet geological research satellite, known as GEOS, and is scheduled to fly in July. RUDAK-2 will not only carry a Mode B linear transponder for SSB and CW contacts but will also carry a variety of packet radio experiments. The digital communication capability of RUDAK-2 is astounding: five different data rates from 400 bps to 9600 bps using various modulation schemes. Radio amateurs will have the choice of using four different uplink frequencies for the various data rates. There is also a provision for digital signal processing (DSP) experimentation. Powering this "super-TNC" will be two on-board computers, providing processing at 15 Million Instructions Per Second (MIPS). RUDAK-2 will be compatible with AX.25 protocol and those amateurs who are equipped for FO-20, PACSAT, LUSAT, AO-13 PSK telemetry, and UO-14 will be ready to use RUDAK-2. The following are the transponder specifications provided by AMSAT-DL:

Amateur Radio Payload: Linear and Regenerative Transponders

Linear Transponder Uplink: 435.030 - 435.120 MHz (90 KHz)
Linear Transponder Downlink: 145.880 - 145.970 MHz (inverted)
Output Power: 12 watts HF maximum.
Beacon : 145.880 MHz, CW telemetry.

RUDAK-II: Two onboard computers with IPS operating systems for packet radio (AX.25) (Mailbox, telecommunications experiment with Digital Signal Processing up to nearly 20 KHz, etc.) 1 MByte RAM disk. Four separate uplink channels.

Gain of satellite RX and TX antennas: 2.3 dBi each (dipoles)

Input sensitivity: < -125 dBm (435 MHz) for a C/No of 45 dBHz

SAT-RX-1: 435.016 MHz +-10 KHz 1200 bps, FSK, NRZIC/Biphase-M (JAS, PACSAT)
SAT-RX-2: 435.155 MHz +-10 KHz (AFC) 2400 bps, BPSK, Biphase-S
SAT-RX-3a: 435.193 MHz +-10 KHz (AFC) 4800 bps, RSM, NRZIC/Biphase-M
SAT-RX-3b: 435.193 MHz +-10 KHz (AFC) 9600 bps, RSM, NRZI (NRZ-S) + Scrambler
SAT-RX-4: 435.041 MHz +-10 KHz (digital AFC) RX for RTX-DSP experiments

The downlink can be switched to the following operating modes:
Transmit frequency: 145.983 MHz

Mode 1: 1200 bps, BPSK, NRZI (NRZ-S) (like FO-20)
Mode 2: 400 bps, BPSK, Biphase-S (AMSAT mode for OSCAR-13 beacon)
Mode 3: 2400 bps, BPSK, Biphase-S (planned for OSCAR-13)
Mode 4: 4800 bps, RSM, NRZIC (Biphase-M) (like 4800 bps uplink)
Mode 5: 9600 bps, RSM, NRZI (NRZ-S) + Scrambler (like 9600 bps uplink)
Mode 6: CW keying (only for special events)
Mode 7: FSK (F1 or F2B), e.g. RTTY, SSTV, FAX, etc (only for special events)
Mode 8: FM modulated by D/A signals from DSP-RISC processor (e.g. speech)

Power consumption: 14V @ 350 mA (max) = 4.9 W;
Standby: 80 mA (RUDAK without power amplifier)

RUDAK-2 is a joint project of AMSAT-U-ORBITA, the Adventure Clubs in Moscow and the AMSAT-DL/RUDAK Group in Marburg, Munich and Hannover.

[ANS would like to thank DB2OS and DJ0HC/KE6MN for providing this information about RUDAK-2]

N4HY Using DSP Techniques To Receive Mode S Packets From DOVE

This week AMSAT Ground Command Station N4HY accquired a Mode S receive only down converter in order to facilitate his efforts in uploading software to DOVE-OSCAR-17. However, due to a low index of modulation on the DOVE S Band transmitter, Bob has had to resort to using Digital Signal Processing (DSP) techniques in order to copy the packets transmitted on 2401.220 MHz. Another factor which has caused him to turn to DSP to upload software is the very high doppler shift present during Mode S passes for low-earth-orbiting (LEO) satellites. On a recent DO-17 pass that WD0E and WD0HHU monitored in the Denver, CO area, it was noted that there was about a 100 KHz shift in frequency from the beginning to the end of the pass at 2401 MHz! With a down converter and a 45 element loop yagi antenna obtained from Down East Microwave, Bob will have to be able to have sufficient signal-to-noise ratio (SNR) to succesfully complete the DOVE software upload process. Stay tuned to AMSAT HF/VHF Nets for further information on the return of DO-17 telemetry to 145.825 MHz.

N6DBF TO COORDINATE DIAL-UP BBSS

HR AMSAT NEWS SERVICE BULLETIN 090.03 FROM AMSAT HQ
SILVER SPRING, MD MARCH 31, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Vice President for Operations, Courtney Duncan, N5BF, announces the appointment of John Wisniowski, N6DBF, Operational Coordinator for Dial-Up Bulletin Board System Activities. In this position, John will be formalizing and expanding the now loosely connected system of dial-up BBSs that carry AMSAT information on a regular basis into the "AMSAT BBS Network."

Systems belonging to the AMSAT BBS Network will be listed as official sources of AMSAT information (AMSAT News Service Bulletins, Orbital Elements, and related releases) in AMSAT publications and will coordinate with N6DBF to set up mechanisms for regular access to the information. Dial-up BBS operators who are now performing this sort of service or would like to be included in the AMSAT BBS Network are asked to contact:

John Wisniowski, N6DBF
1706 Roanoke St.
Placentia, California 92670

or leave a note for JOHN WISNIOWSKI on the DRIG/AMSAT BBS at 214-394-7438.

STS-35 MISSION APPROACHING LAUNCH

HR AMSAT NEWS SERVICE BULLETIN 090.04 FROM AMSAT HQ
SILVER SPRING, MD MARCH 31, 1990
TO ALL RADIO AMATEURS BT

SAREX activities by WA4SIR to be the longest in Shuttle Program

Long standing AMSAT member Ron Parise, WA4SIR, is a Mission Specialist on the Space Shuttle mission STS-35 scheduled to be launched May 9, 1990 from Cape Canaveral. Ron will be carrying a fair amount of amateur radio equipment on this mission and there will be upwards of 120 hours for amateur operation during the 10 day mission.

Ron will operate both 2 meter FM voice as well as 2 meter AFSK packet. The packet station (an HK-21 "pocket-packet TNC" marketed by Heathkit) will transmit bulletins providing updates on the mission and will operate in a ROBOT mode where stations on the ground can connect to the shuttle TNC and obtain a QSO number to validate the contact. The ROBOT should be available for about 90 hours during the flight.

Ron is scheduled to operate the 2 meter voice station during his off hours (for a total of about 30 hours) and he will spend a fair amount of time talking with school classrooms around the world offering them the opportunity to talk directly with an astronaut abord the Space Shuttle. NASA has authorized

SAREX in order to "encourage youth to become excited about science and technology" and to publicize manned spaceflight to the general public.

This past week the amateur equipment to be used on the mission underwent EMI/EMC (Electro-Magnetic Interference/Electro-Magnetic Compatibility) tests. These tests are designed to determine the possibility of any interference the amateur equipment my inflict on any of the shuttle electronic systems. NASA has notified AMSAT that all the equipment passed the tests.

With SAREX on STS-35, Amateur Radio may have an opportunity to further the quest for international cooperation in space. Now that amateur radio activity on the MIR space station appears to have resumed, AMSAT is investigating whether there will be a mutual-visibility window between STS-35 and Mir for a first-ever Shuttle to Mir linkup. Adding to the excitement, the STS-35 Mission Commander is Vance Brand, who participated in the the Apollo/Soyuz program many years ago. Amateur Radio may get front page coverage if this history setting QSO is possible. As further details become available, they will be reported in the AMSAT News Service.

NEW TRACKING PROGRAM AVAILABLE

HR AMSAT NEWS SERVICE BULLETIN 090.05 FROM AMSAT HQ
SILVER SPRING, MD MARCH 31, 1990
TO ALL RADIO AMATEURS BT

SATSCAN-II Now Available in North America

AMSAT-UK has announced the release of their latest satellite tracking program in North America. SATSCAN-II is written for PC compatible computers (XT or AT) and is now available to North American amateurs through Project OSCAR. SATSCAN-II was written by Trevor Stockill (G4GPQ) and is an update of the popular SAT-SCAN program used by many AMSAT-UK members. While in the graphics mode of operation, SATSCAN-II incorporates a graphics display of the world, in full color on an EGA screen. The world map includes a footprint of the coverage area provided by a particular satellite. A math co-processor will improve calculation speed of SAT-SCAN-II but it is not required for operation. CGA equipped PC's can use SATSCAN-II for output in non-graphical format.

SATSCAN-II is fully menu driven for easy operation. It also gives the user complete azimuth and elevation tracking information including squint angle data. Tracking information can be sent to a printer or to a disk file for easy transmission by packet radio, or reproduction in club newsletters. SATSCAN-II also provides the option to determine mutual visibility windows for up to four stations at once, including mutual squint angle data. Therefore, users will know when the best operation times will occur during their schedules.

Keplerian Elements can be imported into SATSCAN-II as a text file in one of three formats:

1 - typical AMSAT-NA multi-line format
2 - two line NASA element format
3 - DCE format as transmitted by UoSAT-OSCAR-11

In addition, Keplerian data may be entered by hand.

SATSCAN-II was originally obtained direct from AMSAT-UK, but is now available in North America from Project OSCAR. All funds received from the SATSCAN-II are directed to future Amateur Radio satellites. For additional information, contact Project OSCAR and include a Self-Addressed, Stamped Envelope.

AMSAT-NA Planning To Be Present At Dayton Hamvention '90

AMSAT-NA Vice President of Field Operations, Jack Crabtree (AA0P) invites all radio amateurs to join AMSAT this year at the Dayton Hamvention on April 27-29, 1990. As has been the tradition for many years, AMSAT will have a booth and will be sponsoring Symposiums on Friday and Saturday. On Friday, the Symposium will focus on the Shuttle Amateur Radio Experiment-2 (SAREX-2) mission with speakers Roy Neal (N6DUE) and Bill Tynan (W3XO). They will be discussing the upcoming STS-35 mission with Ron Parise (WA4SIR) who will operate both 2M voice and packet radio. On Saturday, AMSAT-NA President and General Manager Doug Loughmiller (KO5I) will be the speaker for a Symposium titled "1990: The Year of The Amateur Radio Satellite." This discussion will give a complete run down of all the amateur satellites launched so far this year and what is being planned for the future. Also, Bob McGwier (N4HY) and Jan King (W3GEY) will give a summary of the MICROSAT program. Before and after these Symposiums, all radio amateurs are invited to come by the AMSAT booth to "talk to the experts." Many of the AMSAT-NA Officers and Board of Directors will be present throughout the Dayton Hamvention. Stay tuned next week to the AMSAT News Service (ANS) bulletins for further details about the AMSAT activities planned for the Dayton Hamvention.

W5UN'S EME ARRAY DESTROYED

HR AMSAT NEWS SERVICE BULLETIN 097.02 FROM AMSAT HQ
SILVER SPRING, MD APRIL 7, 1990
TO ALL RADIO AMATEURS BT

Tornado Destroys W5UN's Huge EME Array

AMSAT-NA officials learned this week of the destruction of Dave Blanschke's (W5UN) world famous Earth-Moon-Earth (EME) moonbounce array due to a tornado that touched down at his QTH located near Houston, TX. Many will remember the January '89 QST article spotlighting Dave's EME system and the enormous effort he put into building the world's largest privately owned 2M EME array. Most recently, OSCAR users heard that W5UN assisted AMSAT when it needed all of the 32.5 dBi gain generating about 2 Megawatts EIRP from his moonbounce station to reset the On-Board Computer (OBC) of DOVE-OSCAR-17 (DO-17) three weeks ago. (Due to a software crash, DOVE'S 2M transmitter was overloading the command receiver.) The signal from W5UN's EME station was able to silence DOVE's 2M transmitter. After several tries, W5UN was able to send the reset command allowing N4HY and NK6K to regain control of DOVE and it's battery maintenance system. In all respects, W5UN's EME installation was an exemplary amateur radio station becuse of its ingenious design. W5UN suffered the nightmare that every amateur fears: Total destruction of an antenna system and the years of effort spent building an excellent station. AMSAT-NA would like to express its deepest regrets for W5UN's loss along with its greatest appreciation for his help during the critical period when the DO-17 OBC needed to be reset.

As a final note, W5UN will still be keeping EME schedules using the station of N5BLZ.

FIRST 9600 BAUD TRAFFIC THRU UO-14

HR AMSAT NEWS SERVICE BULLETIN 097.03 FROM AMSAT HQ
SILVER SPRING, MD APRIL 7, 1990
TO ALL RADIO AMATEURS BT

High speed satellite data communication record set.

cmd:C G0K8KA v UOSAT3-1
cmd:*** CONNECTED to G0K8KA VIA UOSAT3-1 [04-Apr-90 22:12:03]

Hi Jeff - a world first??? >>>>
What say
Yes - a bit pedestrian, but what do you expect for a first cut...
Yes, but my tnc doesn't seem too happy with it!
Hmmm - shall I send you the file??? >>>>
I gotta check some asynchronous tlm, so will have to suspend the
pce for a bit. Sorry ....
Yes, try to send it. now>> (* Phew! *)
OK will send. (* So I did *)

This is the first transaction to be digipeated through Oscar-14 at 9600 baud between James Miller, G3RUH and Jeff Ward, G0K8KA. The date and time are 1990 Apr 04 at 2215 UTC, orbit number 1041. This is believed to be the fastest data transmission through an amateur satellite to date.

UoSat-D is on 9600 baud for about 1.5 minutes every 5 minutes, sometimes longer. This signal sounds very like an unsquelched background hiss. However the squelch will be triggered as normal. To determine if UO-14 is in 9600

baud mode look for d:1 in the LSTAT telemetry frame. This means the high speed digi is ON. d:0 means it is OFF. This is the same convention as in the Microsats because the same software is in use for these tests. The downlink frequency was 435.070 Mz, +/- 10 kHz doppler shift. As FM was used, only occasional manual adjustments were needed to the receiver. The uplink frequency used was 145.975 MHz.

Equipment at both ends was FT736R with TX audio direct connected to the varactor, and RX audio directly connected from the discriminator. James reports that the two non-destructive additions to the FT736R took about 30 minutes to implement. Using similar techniques, many of today's commercial transceivers can be modified to allow for similar high speed data communication. A 9600 baud full duplex modem is required to drive the tranceiver and a number of designs are commercially available at present. A comprehensive article describing the G3RUH design is published in the ARRL 7th Computer Networking Conference Papers, Oct 1988, pages 135-140. It can be obtained from ARRL, RSGB and other Society bookshops.

[AMSAT wishes to thank G3RUH for the information for this bulletin and also congratulates James and Jeff for their record setting accomplishment].

Satellite Keplerian Elements to be Broken into Additional Groups

AMSAT's Orbital Data Manager Dick Campbell, N3FKV, announced that this week's release of current orbital elements will be split into more categories. The bulletin ORBS-xxx.O (OSCAR) will contain AO-10, UO-11, RS-10/11, AO-13 and FO-20. These are the satellites with wide band transponders used predominantly for CW, SSB and RTTY communications. The bulletin ORBS-xxx.D (MICROS) will contain UO-14, AO-16, DO-17, WO-18, and LO-19. These satellites are "digital" in nature, using packet communication as the primary modulation technique. The bulletins ORBS-xxx.M (for Manned and Miscellaneous) and ORBS-xxx.W (for weather satellites) will continue to be published in their present format.

Dick indicated that this move is taken to further relieve congestion on packet circuits and allow shorter downloads for users who are interested in only one class of satellites.

Japan AMSAT Organization (JAMSAT) Elects New Board of Directors & Officers

At the 1990 Annual Meeting of Japan AMSAT Association (JAMSAT) that was held on March 18, 1990 in Tokyo the following Board of Directors (BOD) were elected and will serve until 1992:

* JK1VXJ Moriyoshi Ohara
# JM1MCF Yuutai Katou
* JQ1HXT Shinichi Sudo
# JR1FIG Masaya Fukasawa
# JR1ING Youichi Kikukawa
# JR1SWB Mikiyasu Nakayama
# JA2PKI Takeo Okamoto
* JG3XOD Toshihiro Sugimoto
# JH3BJN Sumio Nakane
# JM3MAJ Hiroyuki Oohata
# JA6XKQ Yoshiyuki Takeyasu

Elected Board of Directors
* Nominated by elected Board of Directors

Officers for the 1990-1992 period are:

President - JA2PKI, Takeo Okamoto
Vice President - JR1SWB, Mikiyasu Nakayama
Vice President - JH3BJN, Sumio Nakane
Auditor - JH1CMP, Morizo Iseki

The Board of Directors has established the following goals that they will be working to achieve during the next two years:

1. Transfer of most clerical tasks from volunteer team to a professional organization.

2. Resumption of a membership recruitment campaign.

3. Participation in future OSCAR projects.

4. Improvement of satellite users support.

[ANS would like to thank JA3PKI for providing this information.]

2172. SSTV and the C-64

Newsgroup: rec.ham-radio
Date: 1990-04-08 15:32:58 UTC
From: rockwood@kean.ucs.mun.ca
Message-ID: <76843@kean.ucs.mun.ca>
Source record: 12235

Can anyone help me find some info on SSTV for the Commodore 64.
I have the Edwin Cox software from Viccomm from a few years
back, and I have the article from Ham Radio Magazine, also a
few years back. But I understand there has been some commercial
software available which included formats other than the 8.5
second black and white. Also neither of the two programs I have
now is totally satisfactory. The Expanded Vic-20 program which
Cox did was'nt too bad, but the C-64 program was terribly lacking.
Also neither of the programs I have now can toggle between receive
and transmit, another drawback.
Any help would be appreciated. Please E-Mail.
Art Rockwood VO1AX

What blithering lunacy!! Ham radios don't kill children playing in their
schoolyard!!! If you don't see any difference between guns that kill and
radios that don't, then you yourself are part of the proof that guns MUST
be banned as soon as possible.

Since when is there only one Channel 9? Public service agencies with more
than one channel available commonly use their own channel designators for
tactical reference.

Several years ago someone uploaded to CompuServe's HamNet a program
GRID.BAS that Tom Clark, W3IWI, wrote to not only generate maidenhead grid
coordinates from latitude and longitude but also calculates range and
azimuth betwen two locations. It was still there the last time I looked.

**** UoSAT-OSCAR-11 BULLETIN 212 07 April 1990
UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** UoSAT-OSCAR-14 ** (de G3YJO)

Preliminary tests have been carried out by G0/K8KA & G3RUH using the PACSAT Communications Experiment as a 9.6kbps digipeater, and early data has been received from the Cosmic Particle Experiment.

** UoSAT-OSCAR-15 **

The team at Stanford have succeeded in detecting local oscillator (LO) leakage from the UO-15 command receiver whilst the spacecraft was in eclipse - indicating that the on-board NiCd battery is indeed functioning. Tests to check the command system now follow.

** DOVE-OSCAR-17 ** (ASR)

AMSAT Command Station N4HY is using Mode S to upload software, however, due to a low index of modulation and high Doppler shift on the DOVE S-Band transmitter, DSP techniques are being used to copy the packets transmitted on 2401.220 MHz.

** RUDAK-2 ** (DB2OS & DJ0HC/KE6MN)

RUDAK-2 has now been integrated into a Soviet Geological research satellite, GEOS, scheduled to fly in July. RUDAK-2 will not only carry a Mode B linear transponder but also a variety of packet radio experiments with data rates from 400-9600 bps using various modulation schemes. It will be compatible with AX.25 protocols and those amateurs equipped for FO-20, PACSAT, LUSAT, AO-13 PSK telemetry, and UO-14.

Linear Transponder Uplink: 435.030 - 435.120 MHz (90 KHz)
Linear Transponder Downlink: 145.880 - 145.970 MHz (inverted)
O/P Power: 12 watts max.
Beacon : 145.880 MHz, CW telemetry.

Gain of satellite RX/TX antennas: 2.3 dBi each (dipoles)
Input sensitivity: -125 dBm (435 MHz) for a C/No of 45 dB/Hz

SAT-RX-1: 435.016 MHz +-10 KHz 1200 bps, FSK, NRZIC/Biphase-M (JAS, PACSAT)
SAT-RX-2: 435.155 MHz +-10 KHz (AFC) 2400 bps, BPSK, Biphase-S
SAT-RX-3a: 435.193 MHz +-10 KHz (AFC) 4800 bps, RSM, NRZIC/Biphase-M
SAT-RX-3b: 435.193 MHz +-10 KHz (AFC) 9600 bps, RSM, NRZI (NRZ-S) +Scrambler
SAT-RX-4: 435.041 MHz +-10 KHz (digital AFC) RX for RTX-DSP experiments

The downlink can be switched to the following operating modes:
Transmit frequency: 145.983 MHz

Mode 1: 1200 bps, BPSK, NRZI (NRZ-S) (like FO-20)
Mode 2: 400 bps, BPSK, Biphase-S (AMSAT mode for OSCAR-13 beacon)
Mode 3: 2400 bps, BPSK, Biphase-S (planned for OSCAR-13)
Mode 4: 4800 bps, RSM, NRZIC (Biphase-M) (like 4800 bps uplink)
Mode 5: 9600 bps, RSM, NRZI (NRZ-S) + Scrambler (like 9600 bps uplink)
Mode 6: CW keying (only for special events)
Mode 7: FSK (F1 or F2B), e.g. RTTY, SSTV, FAX, etc. (only for special events)
Mode 8: FM modulated by D/A signals from DSP-RISC processor (e.g. speech)

RUDAK-2 is a joint project of AMSAT-U-ORBITA, the Adventure Clubs in Moscow and the AMSAT-DL/RUDAK Group in Marburg, Munich and Hannover.

2177. Re: how to achieve 20WPM ?

Newsgroup: rec.ham-radio
Date: 1990-04-08 19:46:08 UTC
From: tsf@druhi.ATT.COM
Message-ID: <4734@druhi.ATT.COM>
Source record: 12176

To all you future extra classers out there:

For almost 30 years I was content with a general class license.
I listened to ARRL code practice now and then, just to see if
I could still copy 13wpm. And I worked mostly CW, because with limited
power, and using only indoor antennas, I wanted to get out as far
as possible.

Then someone kindly pestered me to try the ARRL CW contest. I got
hooked on contests. Then they pestered me some more to upgrade to
Advanced and Extra.

Two weeks ago I got a hamfest flyer that said a VE test session would be
held. So I dug in to the Advanced study guide, about an hour a night
after work. That wasn't too bad, so I got the Extra study guide too,
thinking, what the heck, get the written tests out of the way and then
really go for the code. I finished the extra stuff, and with two days
to go until the hamfest, I started in on the computer tutor :-).
I concentrated on QSOs sent at 25, spaced for 22wpm. The day of the
hamfest, I could copy about a half page without missing too much -
I couldn't do random words or code groups very well at all.

I got to the VE session, and the 20wpm test was first on the agenda.
They played a tape in a boom box at the front of a big empty room.
The test started, and I could hardly write. The QSO was a lot wordier
than the simulated QSOs I'd practiced on, but guess what.. they sounded
a lot like what I'd copied on the air for so many years. The code
sounded fast, but a LOT slower than the code I had copied during
CW contests.

The test finally ended, and they handed me the question sheet. I had
missed most of the word "carpenter" but I guessed. I had missed
the state "maine", but I had "m.in". I got those two guesses right,
and choked on the transmitting station's call (I put down the called
station's call!!). SO I PASSED WITH ONE WRONG!

Then two more miracles happened when I passed the Advanced and Extra
written tests.

The moral is: You can do it too!! Real QSO's (static, fading, poor
fists, unpredictable info), CW contest or two, and computer
tutors all seem to help. Also, stay tuned in during the test
as if you're copying your first rare DX or something. Get every
character you can - guesses count these days. GO FOR IT!

I have an Icom 900a Super Multibander System, which I am trying to modify my 49a (440 Mhz) module for out of band tx/rx... I have removed the diode from the control head (and installed one where told to) and I can now make the display go from 420-470Mhz (approx.) but I cannot transmit out of band (the tx led turns on.) I believe that the module has a very narrow range and a person at icom mentioned retunning the VCO, but would not tell me any more.

Does anyone know how to complete the mod and shift the tx up a couple of MhZ? Has anyone done it?

Lance
p.s. no out of band mod flames please.

SHUTTLE AUDIO REBROADCAST

HR AMSAT NEWS SERVICE BULLETIN 098.01 FROM AMSAT HQ
SILVER SPRING, MD APRIL 8, 1990
TO ALL RADIO AMATEURS BT

WA3NAN TO RE-BROADCAST HUBBLE TELESCOPE DEPLOYEMENT STARTING 4/10/90

On Tuesday, April 10, 1990 at 8:47 Eastern Daylight Time (EDT) the Shuttle Discovery will lift off carrying the most complicated un-manned spacecraft ever launched. The Hubble Space Telescope will lofted to an orbital altitude of 400 statute miles and will be deployed with a 28.5 degree orbital inclination. Radio amateurs will have an opportunity to hear all the excitement "live" from NASA thanks to the hams at the Goddard Amateur Radio Club (GSFC ARC) and the other NASA affiliated radio clubs, eg., W5RRR at JSC, W6VIO at JPL. The following frequencies will be used to re-broadcast the live audio during the six day mission:

3860 KHz
7185 KHz
14.295 MHz
21.395 MHz
28.650 MHz.

The Shuttle audio re-broadcast will start about ONE HOUR BEFORE LAUNCH and will only be in operation when the astronauts are awake. The astronauts work day will commence at around 3:00 A.M. EDT and they will turn in around 7:00 P.M. EDT. The Hubble Telescope will be deployed at 7:30 A.M EDT on Wednesday April 11, 1990. Amateurs and space enthusiasts might particularly want to listen during that time because it will be a period filled with a lot of activity. For those who wish to track the Shuttle for the purposes of visual contacts, Frank Bauer (KA3HDO), President of the Goddard Space Flight Center Amateur Radio Club (WA3NAN) says that every hour the orbital elements will be read by the GSFC club members who will be operating the station. AMSAT encourages all radio amateurs to listen to the live audio from the Shuttle during this history making flight.

[For those who would like to download more information about this Shuttle Mission, all are invited to check into the NASA sponored SPACELINK BBS at

(205) 895-0028. The phone number of the GSFC ARC hamshack is (301) 286-6673]

But ham radio operators are facing organized forces which are probably more
powerful than the anti-gun forces. These are the commerical groups that
covet our frequencies. They are better financed and work quietly in the
background (underground,under-table ??) and usually by the time we find out
what is going on it is too late to do much about it.

I also feel that you took the comments made by Neal wrong. My reading of his
comments were about the way that media handled the subject (radio) as opposed
to the way they handle the subject of guns. On last nights Connie Chung program

they covered the subject of guns in movies. Included in this discussion were quotes such as ".. if guns were once props in moves, they now enjoy star status themselves" and ".. box office power often comes out of the barrel of a gun." by Paula Zahn, Connies replacement this week. Could you imagine it if things were turned around and movies started showing ham radios being used by criminals and the media picked this and started publishing articles about how a small number of "hobbieists" are tying up "Millions" of dollars worth of commerical frequencies.

And also in reply to your comments about "blithering lunacy", guns don't kill children playing in schoolyards it is usually lunatics that are imitating what they see in the movies or on tv.

I think that any further discussions along these lines should be moved to talk.politics.guns.

I cannot let Mr. Grubs blithering lunacy go here. Banning guns
will not (and has not) solved ANYTHING. It has (witness
Washington D. C. , murder capitol of the U. S., where guns ARE
banned. There was a specific purpose for including the 2nd
amendment in the Bill of Rights (the right to keep and bear
arms), and that prupose is even more valid today than ever.
(hint: it's not for "sporting purposes")

Agreed, Patrick Purdy deserves the maximum punishment, and his
name is pornography in our household, but banning guns is NOT
the answer.

BTW, there ARE organized groups dedicated to banning ham radio.
Witness the zoning restrictions in Colorado and "Deed
restrictions" recently discussed here.

Followups to talk.politics.guns please.

> (especially you elmers out there :-).

I am currently working on putting together a transmitter and receiver for the brand-new 18Mc band; the transmitter is the 6W VXO-Controlled Transmitter in the 19XX Radio Amateur's Handbook (an invaluable reference which I didn't see on your list). The receiver will be a cobbled-together design based on the NE-602 RF-amp/mixer/oscillator chip. If you're interested (and if I make it work...) I can send you the design.

> I would also like to hear recommendations about books, magazines, etc.

> it locally.

Someone else has started a thread on the topic of mail order houses on sci.electronics/rec.ham-radio, so perhaps they will have a more complete list. Here are the places I use:

(New parts)
Digikey
P.O.Box 677
Thief River Falls, MN 56701-9988
1-800-DIGI-KEY
No minimum, $3 shipping for under $25, discounts for over $100, weak on radio specific parts.

Circuit Specialists
P.O. Box 3047
Scottsdale AZ 85271-3047
1-800-528-1417
Minimum $15 (except none for check or money order), $3 shipping, fairly good selection of radio parts.

Amidon Associates
12033 Otsego Street
North Hollywood CA 91607
All those damned, mysterious T37-6 cores specified in construction articles which semi-baffle us "old farts" (even us young OFs) who want to see uH and n linear inches of m-inch coils?[1] Amidon (and others) makes them. Prices

from Amidon are a little higher than what one can find elsewhere, but they ship VERY fast -- I've gotten orders back in a week, and that's very nice.

Mouser Electronics Mouser Electronics Mouser Electronics
1433 Woodside Avenue 2401 Highway 287 North 12 Emery Avenue
Santee CA 92071 Mansfield TX 76063 Randolph NJ 07869
--> 1-800-34-MOUSER <--
$20 minimum (add $5 if under); shipping charges according to shipping method ("check or money order: add 10% -- credit or refund will be issued for any over-amount"); wide selection. They also ship quickly, but I've found them to be prone to discovering the need to back-order something between the phone call and the shipment...

Jameco Electronics
1355 Shoreway Road
Belmont CA 94002
(415) 592-8097
$25 minimum; shipping charges vary. Mostly they sell computer parts; they still carry a number of analog ICs and the usual resistors, capacitors, etc. Maybe if enough people try to buy analog stuff from them they'll abandon this digital fad and get back to real electronics. ;-) I've heard some people complain about their service, but I've had reasonably good luck (they goofed one order a bit, but sent the correct item promptly).

MCM Electronics
650 Congress Park Drive
Centerville OH 45459-4072
1-800-543-4330
$20 minimum ($25 charge); shipping varies, plus at least $2 handling. They cater mostly to repair technicians, so they don't have a lot of stuff you might expect to find, but they do have a lot of stuff you might not find anywhere else. Their salespeople have also been extremely helpful and friendly.

Crystek Corporation
2351/2371 Crystal Drive
P.O.Box 06135
Fort Myers, Florida 33906-9963
1-800-237-3061
$10 minimum for charges, shipping varies (and isn't heinous). They seem to be the least expensive crystal manufacturer. Crystals are like $6-$9 depending on frequency, form factor, and tolerance.[2]

JAN Crystals
2341 Crystal Drive
P.O.Box 06017
Fort Myers, Florida 33906-6017
1-800-JAN-XTAL
Almost identical to Crystek (including the address). Just a tad more expensive. The catalog I have shows more pre-made crystals for various commercial rigs (including some 2-meter transceivers), plus they have a "special" on amateur crystals in FT-243 holders (which actually is the same price as their regular cases for similar tolerance); Crystek didn't

seem to have FT-243 holders available (but I don't have their full catalog, and won't for a while, since they said they've run out for now...).

Radiokit
[alas, I can't find their catalog.]
Pelham NH
Radiokit has a number of kits (gee!), and some selection of parts, including a wide variety of VARIABLE CAPACITORS (which I've found to be as rare as hen's teeth. Now I know that good ones are as expensive, too...).

(Favorite surplus outfits)
Marlin P. Jones & Assoc.
P. O. Box 12685
Lake Park FL 33403-0685
(407)846-8236
No minimum (add $1 under $10), shipping like $2 plus UPS. Lots of electronics stuff, random other things (pressure gages, lenses, freon tank conversion kit, motors, etc.).

All Electronics Corp.
P. O. Box 567
Van Nuys CA 90408
1-800-826-5432
$10 minimum, $3.50 S&H. They lie; magnets aren't electronics. Other than that, they're a great place to deal with.

R&D Electronics
1224 Prospect Ave.
Cleveland OH 44115
1-800-642-1123 (tuesday through saturday)
$10 minimum (unless you're a school with a purchase order, in which case it's $25), S&H per UPS. Lots of motors, also a lot of electronics stuff. Seems like a more random collection than MPJ and All-Elect. above.

Hosfelt Electronics
2700 Sunset Boulevard
Steubenville OH 43952
1-800-524-6464
No minimum; $3.75 S&H under $101, $4.75 under $251, free above that. I think they're surplus; their catalog has that "random grab-bag" look, but they have a very well-stocked grab bag.

Surplus Sales of Nebraska
1315 Jones Street
Omaha Nebraska 68102
(402)346-4750
No minimum; at the moment, no catalog, for they are still preparing their next catalog, and have run out of their previous, so all I have is "Supplement 5A" from which I've used the order form... They say they have a wide selection of hard to find parts, and the index I have lists air-variable capacitors (which I've found hard to find) and B&W coil stock (oh boy! see [1] ;-). They also have bus seats available (get 'em while they're hot![3]).

Well, that's it for the sheaf of catalogs I grabbed. If I missed any really good ones, I'll post another article (or if someone announces that they are collecting this kind of info, I'll mail it to them).

Very 73, John Woods WB7EEL

[1] When I was starting out in ham radio, I was sort of puzzled by toroids, since I didn't know where to get them, and it also seemed kind of annoying to have to stock a zillion different types in order to be able to cobble up random projects. Now, at least, I know where to get them, and have stocked a dozen or so different types -- that still seems annoying, but less so once I sat down and tallied which types were used in, say, the 1988 Handbook...

[2] Crystals were another thing that I found intimidating when starting out. Don't worry, the folks at Crystek were certainly friendly, and I'm sure JAN is just as nice. Crystals are a bit expensive if you need more than a few, so don't plan on covering all of 10m with crystals spaced 1Kc apart...

[3] They bought a school bus for travelling to hamfests, and didn't need all the seats. So, with a big grin, they put the spare seats into the catalog.

2184. Litz wire again and how to solder it.

Newsgroup: rec.ham-radio
Date: 1990-04-09 09:37:53 UTC
From: Wickham.SBDERX@XEROX.COM

I spotted this whilst reading through the November 1985 RSGB Mag "Radio Communication"

Printed in Technical Topics, provided by G.H.Lucas G3TWE.

"Fill a small container with methylated spirits(a bottle cap is ideal) and light it. Place the end one inch or so in the flame to burn off the insulation., remove it and blow the burning insulation out. Next replace the wire in the flame and heat until the wire is red hot, then quench the wire rapidly by immersing it in the unburnt spirits, and remove quickly. The result is clean multi-strands of wire that may be twisted together, tinned and soldered in the conventional manner."

The term "Litz" was derived from the German Litzendraht (Litz - strand, draht - wire) and is correctly applied to conductors which are built up by successive stranding of wires or groups of wires in groups of three, each individual wire being insulated with enamel or silk, although often applied also to what are more correctly termed 'textile-covered bunched enamelled-copper wire conductors'. Litz wires were developed for use in which skin effect becomes significant."

There is a little more but that should be enough on the subject.
Please note I am not the expert - just repeating what was printed.

Regards,
Richard

If anyone's interested in this Maidenhead system and has a HP28 or HP48 handheld calculator, here are some routines that will workout the Maidenhead location from lat/long and vice-versa. Also routines to calculate great circle distances once you have the locator.

73
James

I have no professional connection with Hewlett-Packard's calculator operations other than as a user of their products.

Opinions expressed are my own, and are not intended to be an official statement by Hewlett-Packard Company

QRA Locator Square Translator: The following procedures translate between the worldwide QRA (or ANB or Maidenhead, whatever its called) locator system used by Radio Amateurs.

->QRA Takes Latitude from stack level 2, and Longitude from level 1 and returns a string with the Locator. South and West are negative. The input should be in DD.MMSS format. The input is tested to ensure that it is +-90 and +-180 respectively. For example, take QTH C->R ->QRA gives "IO85HX" for my locator.

QRA-> Takes a string from the stack level 1 and returns the Latitude in level 2 and Longitude in level 1 of the square center. This is the inverse of ->QRA. The output is in DD.MMSS. Some error trapping is done on the input, but it is not foolproof.

Great Circle Distance & Bearings: Calculates the distance between your station and the remote station, also gives beam heading required.

GCIR Takes the output of QRA-> (Lat and Long) and uses the Lat and Long in QTH to compute the great circle distance and bearing from QTH to the stack Lat and Long. The distance is returned in Level 2, in Km. The bearing, in DD.MMSS from north (+E,-W) is returned in Level 1. This program assumes the earth is a perfect sphere (we all know this is an approximation as the earth is actually flat :-). This program uses the PRESERVE

routine given in the manual to ensure degrees mode is used.

QTH Must contain the complex number (Lat,Long) representing your
stations position.

ERAD Must contain the equatorial radius of the earth. I use:
6378.888
which is in Kilometers, thus the answer to GCIR is in Km,
you can use UNITS to change this constant if you wish.

Radio Horizon: Calculates the flat-band line of sight communication
distance at VHF.

HORIZ Returns the distance between a point on the earth and the
VHF radio 'horizon' given the height above sea level. The
height is taken from level 1, and the distance returned in
level 1, both will be in the same units as ERAD. e.g. For
914m ASL enter 0.914 to give an answer of 124.68 Km. Note
this is NOT the same as the line of sight horizon, as it
includes a correction of SQR(4/3) to allow for tropospheric
bending.

The Procedures:

```
->QRA Checksum BC9E
<< HMS-> 180 + SWAP HMS-> 90 + -> lo la
<< IF lo 0 < lo 360 > la 0 < la 180 > OR OR OR
THEN la 90 - lo 180 - "Lat/Long out of range" 1 DISP
2 WAIT ABORT
END
lo 20 / IP 65 + CHR
la 10 / IP 65 + CHR
lo 20 / FP 10 * IP 48 + CHR
la 10 / FP 10 * IP 48 + CHR
lo 2 / FP 24 * IP 65 + CHR
la FP 24 * IP 65 + CHR
>> + + + + +
>>
```

```
QRA-> Checksum 9E77
<<
<< "Not valid QRA" 1 DISP 2 WAIT 'er'
>> STO
DUP IF TYPE 2 <> THEN er PURGE ABORT END
DUP IF SIZE 6 <> THEN er PURGE ABORT END
-> q
<< 1 6 FOR i q i DUP SUB NUM 65 - NEXT
-> a b c d e f
<< 'b*10+(d+17)+f/24+1/48-90' EVAL ->HMS
'a*20+(c+17)*2+e/12+1/24-180' EVAL ->HMS
>>
>> 'er' PURGE
```

```
>>

GCIR Checksum 6369
<<
<< DEG HMS-> SWAP HMS-> QTH C->R HMS-> SWAP HMS->
4 ROLLD ROT -
DUP IF 180 > THEN 360 - END
DUP IF -180 < THEN 360 + END
IF DUP 0 == THEN .000001 + END ! ensures we dont divide by 0
-> lah laa dif
<< 'ACOS(SIN(lah)*SIN(laa)+COS(lah)*COS(laa)*COS(dif))' ->NUM
DUP 180 / pi * ERAD * ->NUM SWAP -> dis
<< 'ACOS((SIN(laa)-SIN(lah)*COS(dis))/(COS(lah)*SIN(dis)))'
->NUM
>>
IF dif 0 > THEN NEG END ->HMS ! correction for E or W of N
>>
>> PRESERVE ! in HP28 Operator Manual
>>

HORIZ Checksum 6E8B
<< ERAD * 8 * 3 / SQR
>>

ERAD 6378.388 ! in Km

QTH (55.5910 , -3.244) ! in DD.MMSS

Note <> not equal to
SQR square root
-> right arrow
pi symbolic constant for circumference/diameter of a circle
```

2186. Lo-Jack

Newsgroup: rec.ham-radio
Date: 1990-04-09 11:39:26 UTC

CEO summary:
This system has been in operation for a couple of years here in Mass. One of my friends had it installed in his car. The way it works is that *you must first report your car stolen*. The police then enter the registration number into their stolen car computer system & the Lo-Jack people are linked into this system. They check to see if the VIN matches any of the ones they've installed transmitters in. If so, they start trying to activate the "transponder" in your car. There's a nationally allocated frequency for this (173.075 I think, I have it at home). If you listen to this frequency, you can hear something that sounds like packet...that's their activation signal. My friend was listening to his scanner one night and heard the local cops chasing a beaconing Lo-Jack equipped car. They found it and the thieves abandoned it and got away. The cops saw the thieves leaving the car!
Several drawbacks: (1) Nothing happens until you notice your car's gone. (2) Smart crooks leave the cars to cool off for a day or two before picking them up again. (3) You need a cop who knows how to DF.

2187. Re: Alf a Ham?

I did not see the episode in question as it aired, but caught it on my VCR. I watched it, then rewound it and checked the pattern he was sending.

He was sending on an MFJ-557 (like I use in my code classes!) and he definitely sent a W6 callsign. I could not tell the last two letters because they were run together. The last two letters were either SC or VR... I forget the first letter of the call I wrote down. When I looked in the callbook there was only one of the two calls listed.

The hand that was sending, I would say, definitely knew what it was doing.
